In this issue
Articles on prices, collective bargaining, and State labor legislation in 1981

L 2.6:

U.S. DEPARTMENT OF LABOR
Raymond J. Donovan, *Secretary*

BUREAU OF LABOR STATISTICS
Janet L. Norwood, *Commissioner*

The Monthly Labor Review is published by the Bureau of Labor Statistics of the U.S. Department of Labor. Communications on editorial matters should be addressed to the Editor-in-Chief, Monthly Labor Review, Bureau of Labor Statistics, Washington, D.C. 20212.
Phone: (202) 523-1327.

Subscription price per year —
$23 domestic; $28.75 foreign.
Single copy $3.50
Subscription prices and distribution policies for the Monthly Labor Review (ISSN 0098-0818) and other Government publications are set by the Government Printing Office, an agency of the U.S. Congress. Send correspondence on circulation and subscription matters (including address changes) to:
Superintendent of Documents,
Government Printing Office,
Washington, D.C. 20402

Make checks payable to Superintendent of Documents

The Secretary of Labor has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through October 31, 1982. Second-class postage paid Laurel, Md.

Library of Congress Catalog
Card Number 15-26485

January cover:

Detail from *Carting Snow from the Streets*, 1867, an engraving by Stanley Fox, from *New York in the Nineteenth Century: 321 Engravings from Harper's Weekly and Other Contemporary Sources*, by John Grafton.

MONTHLY LABOR REVIEW

JANUARY 1982
VOLUME 105, NUMBER 1

Henry Lowenstern, Editor-in-Chief
Robert W. Fisher, Executive Editor

Paul O. Flaim 3 **The spendable earnings series: has it outlived its usefulness?**
Questions are raised about its accuracy, relevance, and concepts; statistical evidence indicates the series has been seriously deficient in tracking 'spendable' earnings

W. Thomas and others 10 **Large meat, grain supplies cut recent food price increases**
Food prices helped to hold down the overall rate of inflation in the first half of 1981, although a resurgence took place during the third quarter

Douglas R. LeRoy 16 **Scheduled wage increases and cost-of-living provisions in 1982**
Deferred increases will average 6.3 percent, more than in any year since 1971, and are payable to 4.3 million workers; cost-of-living clauses cover 3.4 million

George Ruben 21 **Organized labor in 1981: a shifting of priorities**
The quickened pace of wage-and-benefit concessions and employment declines in major industries left the movement with little to celebrate during its centennial

Richard R. Nelson 29 **State labor legislation enacted in 1981**
The minimum wage was raised in 26 jurisdictions, sometimes above the Federal rate; more attention was paid to protecting 'whistleblowers' and workers in plant closings

Labor Month In Review

JOB SAFETY. Job-related injuries and illnesses declined in 1980. The Bureau of Labor Statistics' annual survey, conducted in 1981, shows that 1 injury or illness occurred for every 12 workers in the private economy during 1980. The ratio was 1 out of 11 in each of the previous 4 years.

The latest survey also shows that incidence rates and total cases fell for the first time in 5 years. The incidence rate fell from 9.5 injuries and illnesses per 100 full-time workers in 1979 to 8.7 in 1980. About 10 percent of the 0.8 decline in the incidence rate was the result of a decrease in total hours worked between 1979 and 1980.

In 1980, work-related deaths in units with 11 or more employees also fell—from 4,950 in 1979 to 4,400 in 1980. The fatality rate fell from 8.6 per 100,000 workers in 1979 to 7.7 in 1980. Over the 2-year period from 1979 to 1980, 30 percent of all occupational fatalities were associated with the operation of cars and trucks. (See page 49 for a report on job-related deaths.)

Occupational injuries. Occupational injuries occurred at a rate of 8.5 per 100 full-time workers during 1980—down from 9.2 in 1979.

Among industry divisions, only agriculture, forestry, and fishing showed a slight increase in the incidence of injuries. Rates for the remaining seven industry divisions fell.

Of the 69 major industry groups, incidence rates decreased in 57, increased in 9, and 3 remained at the 1979 level. Incidence rates for injuries involving lost workdays decreased in 48, increased in 9, and were unchanged in 12 of the 69 industries.

The severity of injuries is reflected in the incidence rate of lost workdays. In 1980, there were 63.7 lost workdays per 100 full-time workers due to injury—down from 66.2 in 1979. Mining was the only industry division to show an increase in the lost workdays rate; it had the highest rate of lost workdays among all industry divisions. Since 1977, the lost workdays incidence rate in mining has been more than twice the national average.

Injury incidence rates in establishments with fewer than 50 or more than 1,000 workers were lower than in mid-size establishments. Rates continued to be highest in establishments with 100 to 249 employees.

About 6.0 million work-related injuries occurred in 1979 compared with nearly 5.5 million in 1980—a decline of about half a million cases. Both lost workday injuries and nonfatal injuries without lost workdays decreased. As in 1979, 45 percent of all injuries involved lost worktime.

There were 1.7 million fewer days lost due to occupational injuries in 1980 than in 1979. The 40.9 million workdays lost in 1980 represent lost work time equivalent to a full year's work for nearly 163,600 employees.

Occupational illnesses. The recording and reporting of illnesses continue to present measurement problems, since employers (and physicians) often are unable to recognize some illnesses as work-related. The annual survey includes data only on the incidence of visible illnesses of workers. To the extent that occupational illnesses are unrecognized and, therefore, unreported, the survey estimates understate their occurrence.

Occupational illnesses include any abnormal condition or disorder, other than one resulting from an occupational injury, caused by exposure to environmental factors associated with employment. The incidence of occupational illnesses measured by the annual survey refers to the number of new illness cases occurring during a year and does not measure continuing conditions of illness reported in previous surveys. Illnesses are recorded only for the year in which they are recognized and diagnosed as work-related.

Nearly 130,200 occupational illnesses were recognized in 1980; the number recognized in 1979 was 148,000. During this period, the number of illnesses decreased in 7 of the 8 industry divisions; cases increased in agriculture, forestry, and fishing.

As in previous years, skin diseases or disorders continued to account for the majority of all illnesses—about 4 of every 10 cases. This is largely because they are more readily observable than other illnesses.

Background of survey. The Annual Survey of Occupational Injuries and Illnesses is a Federal/State cooperative program in which State agencies participate with the Bureau of Labor Statistics of the U.S. Department of Labor. Response to the 1980 survey was mandatory. The sample consisted of 280,000 units in the private sector.

The occupational injury and illness data reported through the annual survey are based on the records which employers maintain under the Occupational Safety and Health Act of 1970.

A BLS bulletin with full survey details is planned for publication later this year. ☐

Rebasing of price indexes delayed

Because of severe budget constraints, the Bureau of Labor Statistics has not been able to carry out by January 1982 the Government directive to rebase the Consumer Price Index and the Producer Price Index to the new Federal 1977 = 100 reference base. Postponement is required because of the direct production work necessary to prepare the data and the information services to explain the change. No alternative date for adopting the 1977 reference base has been set.

The spendable earnings series: has it outlived its usefulness?

Enough questions have been raised about accuracy, relevance, and concepts to suggest that this is a series whose time is up; statistical evidence indicates that the measure has been seriously deficient in tracking 'spendable' earnings

Paul O. Flaim

Are American workers "better off" now than they were 5 or 10 years ago? That is, considering wage and inflation trends, have workers been making further gains or losing ground in terms of the purchasing power of their earnings?

The answers to this question can vary considerably, depending on what statistical series is used to determine the basic trends in gross earnings and on what calculations and assumptions are made in translating the statistics on gross earnings into estimates of purchasing power.

One of the statistics most often used to depict the trend in purchasing power of American workers has been the "real spendable weekly earnings of workers with three dependents." This series, published monthly by the Bureau of Labor Statistics, was initiated about four decades ago. Its initial purpose was to keep track of the purchasing power of factory workers by taking into account changes in consumer prices as well as deductions from pay for Federal income taxes and social security contributions. In the early 1960's, the scope of the series was expanded to all production and nonsupervisory workers in the private nonfarm economy. The following tabulation shows the trend in this series (in 1977 dollars) over the 1950–80 period:

1950	$131.08
1955	143.46
1960	149.20
1965	166.28
1970	163.65
1975	164.02
1980	151.65

According to the tabulation, real spendable weekly earnings grew steadily and significantly from 1950 to 1965, were stagnant until 1975, and then dipped considerably over the next 5 years. Why this change in trend? Is it possible that, after making considerable progress over the 1950–65 period, the average American worker lost ground in terms of purchasing power over the next 15 years?

As will be shown in this article, the change in the trend of the spendable earnings series in the mid-1960's did not stem from any sudden change in the earnings of individual workers. Rather, it reflects demographic and social changes which began at about that time and which greatly altered the composition of the labor force over the next 15 years.

Paul O. Flaim is chief of the Division of Labor Force Studies, Bureau of Labor Statistics.

Comparisons with other earnings and income series indicate that the majority of American workers have made further progress in terms of purchasing power over the 1965–80 period, even though they may indeed have suffered a dip after 1975 when inflation intensified. These comparisons also show that workers who are likely to have three dependents earn—and take home—much more than is indicated by the "spendable earnings" series.

More representative in early days

Computation of the spendable earnings series began in 1939. Records do not show why the series was started, but it should be recalled that the Social Security Act had gone into effect in 1937, and the need must have soon arisen to measure the effects of the deduction for social security as well as those for Federal income taxes on the take-home pay of typical factory workers.

To measure the impact of Federal income taxes, two series were started, one for workers assumed to have three dependents (a nonworking wife and two children) and one for those assumed to have no dependents. It is important to note, however, that both series were based on the same earnings average—that for all production workers in manufacturing. In subsequent years, the series for workers with three dependents became the more prominent and widely quoted of the two, presumably because of the greater interest in the earnings situation of a family's principal breadwinner.

Of course, in 1939, and even in the years immediately following World War II (although not necessarily during the war), the factory labor force was much more male dominated than is now the case. In fact, this was also true in other industries, as the labor force participation rate for women, especially wives, was extremely low. Thus, the use of the earnings average for all factory production workers to represent the earnings of a factory worker with three dependents was not unsound in the early days of the series.

And the fact that no allowance was made for deductions for State and local taxes in translating the gross earnings of factory workers into "spendable" (or after-tax) earnings also was not a significant omission in those years. It was only after World War II that State and local income taxes began to take a significant and growing portion of a worker's earnings, a trend that continued at least until the recent advent of "Proposition 13" and similar measures designed to limit local tax burdens.

The deductions for social security and Federal income taxes were also extremely low in the early days of the spendable earnings series. In 1939, for example, a factory worker whose gross weekly earnings equaled the average for the industry—$23.86—took home $23.62 if he had three dependents and $23.58 if he had no dependents. In either case, the total deductions barely exceeded 1 percent, a far cry from the situation in 1980, when comparable deductions totaled 14 percent for a worker with three dependents and 22 percent for one with no dependents. And this does not take into account any deductions for State and local taxes.

All things considered, the spendable earnings series, as constructed in its early days, gave a reasonable approximation of the take-home pay of a worker with three dependents. This was particularly true when the series was limited to the manufacturing industry, where men (many with three or more dependents) made up a majority of the work force. But, the situation has changed radically since those early days, and there has been mounting evidence that the series has become less representative of the earnings situation of workers with three dependents.

Growing problems and criticisms

In 1964, the coverage of the spendable earnings series, previously limited to production workers in manufacturing, was expanded to include production and nonsupervisory workers in all private nonfarm establishments. In retrospect, this change made the series much more susceptible to the effects of the pervasive demographic and social changes which, over the next 15 years, greatly altered the makeup of the American work force.

The mid-1960's marked the beginning of a large and sustained increase in labor force participation among women age 20 to 40. It was also during that time that the leading edge of the huge post-World War II baby-boom generation reached age 18 and began to enter the job market. Suddenly, women and teenagers began to account for most of the year-to-year gains in the work force. Many of these new workers took only part-time jobs, but even if working full time (as most of them eventually did), they were generally paid much less per week than men who had been at their jobs for many years. Thus, as women and teenagers increased their proportion of the work force, the average weekly earn-

'Spendable earnings' discontinued

Since the preparation of this article, the Bureau of Labor Statistics has announced the termination of the "spendable earnings series" with the publication, in January 1982, of the data for December 1981. Discontinuation of the series was a specific recommendation of the National Commission on Employment and Unemployment Statistics and was endorsed by the Secretary of Labor in his final report to the Congress on the recommendations of the Commission, dated October 26, 1981.

ings for all production and nonsupervisory workers (which formed the base of the spendable earnings series) no longer grew as fast, even though there was no change in the earnings trends for individual workers.

By the early 1970's, some economists were already arguing that, because of the change in the composition of the labor force and other developments, the spendable earnings series no longer provided a reliable indication of the true trend in earnings. For example, in 1972, George Perry of the Brookings Institution called the series "most misleading" for having signaled a halt in increases in real wages when, in his view, none had occurred.

Perry noted that the failure of the series to show any further growth during the late 1960's was due primarily to (1) a change in the mix of workers; (2) a related decline in hours worked; (3) an increase in deductions for Federal income taxes (the reference being to the surtax of 1968); and (4) the use of what he claimed to be an inappropriate deflator to measure the impact of price changes on earnings.[1]

The Bureau of Labor Statistics reacted to this criticism in various ways. First, it endeavored to explain more specifically what the spendable earnings series did and did not represent. It emphasized that the series, as related to workers with three dependents, applied only to those whose gross earnings were equal to the average for all production and nonsupervisory workers. The Bureau also sought, through several analytical efforts, to place the spendable earnings series in proper perspective by comparing its levels and trends to those of other earnings and income series.[2] And, as the 1970's progressed, it developed alternative measures of earnings from payroll data which would be less affected by changes in the mix of workers—the Hourly Earnings Index and the Employment Cost Index.[3] And finally, it expanded the collection and publication of demographically oriented earnings data through the Current Population Survey (CPS).[4]

Despite these and other efforts to shed more light on earnings and thus reduce the misuse of the spendable earnings series, this statistic has continued to be criticized. In 1979, the National Commission on Employment and Unemployment Statistics reported that the series " . . . is misleading because it is not the earnings figure associated with a married male with three dependents; it is simply an average of all workers' earnings with deductions for Federal income tax liabilities and social security adjusted for inflation. This hybrid figure does not measure what it purports to measure."[5]

And in 1980, Geoffrey Moore, former Commissioner of Labor Statistics, was also critical of the series. Moore said that although the Bureau had endeavored to explain what the series did and did not do, "These statistics have become one of the most misleading series published by the Federal Government. They are subject to a large and increasing downward bias."[6]

Comparisons with other data

Was the criticism of the spendable earnings series sound? If so, to what extent has the series been understating the level and trend in earnings of a worker with three dependents? These questions are addressed in the following comparisons of the data underlying the spendable earnings series with data from other sources.

Current Population Survey (CPS). The earnings data obtained through the CPS, while subject to some limitations, are more suitable for tracking the earnings of specific groups of workers than are the data obtained from establishment surveys. This is because the CPS data are obtained separately for individual workers in the sample and can be linked with the information on marital status, family situation, and other characteristics of these individuals. From 1967 to 1978, data on weekly earnings were obtained through the CPS in May of each year. Beginning in 1979 they have been collected monthly (although from only one-quarter of the sample) and are published quarterly. These data are most useful in determining the accuracy of the spendable earnings series.

The earnings *level* which underlies the establishment-based series on the spendable earnings of workers with three dependents is compared below with CPS data on the earnings of workers who actually have three dependents. For this purpose, the CPS data are limited to a universe of husbands in full-time wage and salary jobs who have a wife and two children under age 18. Using the weekly earnings data for this universe, two separate arithmetic means were constructed, one for production and nonsupervisory workers in the private nonfarm sector (the same universe as that used in computing the establishment-based earnings averages) and one for the entire economy, including supervisory and nonproduction personnel as well as rank-and-file workers. Following are CPS averages, based on data culled from the microtapes for March, May, and October 1979, which are compared with the average (mean) weekly earnings for the same 3 months based on data from the establishment survey:

	Mean gross weekly earnings
Establishment-based average	$219
CPS-based averages:	
Men in full-time production and nonsupervisory jobs in private nonfarm sector who have a wife and two children under age 18	316
Men in all full-time wage and salary jobs who have a wife and two children under age 18	357

From the data, it is clear that average weekly earnings from the establishment survey used to compute the spendable weekly earnings for workers with three dependents has, at least in recent years, fallen far short of the actual earnings of this group of workers. According to the CPS, these workers earn 44 percent more than the establishment-based average if the comparison is restricted to full-time private production and nonsupervisory jobs, and 63 percent more if the CPS universe is expanded to all full-time wage and salary jobs.[7]

The establishment-based series is much lower than the CPS figures because the former is an average for all workers, whether in full- or part-time jobs, and regardless of age, sex, marital status, and family makeup. As noted earlier, among this amorphous group of workers has been a rapidly increasing proportion of women and youth whose weekly earnings are much lower than those of men of prime working age.[8] In contrast, the two CPS averages are limited, almost by definition, to the earnings of men of prime working age.

While the preceding comparisons establish that the actual earnings *levels* for workers with three dependents differ radically from the average earnings of all production and nonsupervisory workers, it is perhaps even more useful to compare the *trends* in earnings of these two widely different universes. Table 1 relates trends in the establishment-based mean gross weekly earnings with trends in median weekly earnings for the most important groups of workers as reported in the CPS. The data are for 1967 (the first year for which data on weekly earnings were collected in the CPS) and 1980.

Both measures exhibited roughly the same percentage increase (or decrease in constant or real dollars) for universes that include full- and part-time workers. This indicates that the measures have been equally sensitive to the changes in the composition of the work force in terms of its full-time and part-time components and in terms of the demographic mix within these components. Most important, however, is what the CPS data show in terms of the earnings trends for full-time workers, and particularly for those 25 years and over. Whereas the earnings for all wage and salary workers declined by 6.9 percent in real terms over the 1967–80 period, those for full-time workers 25 years and over, who still make up the majority of the work force, show increases of 6.1 percent for men and 11.3 percent for women. Only for younger men and women (16 to 24) do the CPS data indicate a significant decline in real weekly earnings. This decline has been widely attributed to the rapid expansion of this young age group and to the keen competition that its members face upon entering the labor force.[9]

Table 1. Weekly earnings in 1967 and 1980, as measured in the establishment survey and in the Current Population Survey (CPS)

Series	May 1967	Annual average 1980	Percent change	
			In current dollars	In constant (real) dollars
Establishment-based:				
Mean weekly earnings for all production and nonsupervisory workers on private nonfarm payrolls	$100.55	$235.10	133.8	−5.9
CPS-based:				
Median weekly earnings for —				
All wage and salary workers	100.00	232.00	132.0	−6.9
Full-time wage and salary workers	109.00	266.00	144.0	−1.8
Men, 25 and over	131.00	346.00	164.1	6.1
Women, 25 and over	79.00	217.00	174.7	11.3
Men, 16 to 24 years	97.00	214.00	120.6	−11.2
Women, 16 to 24 years	74.00	171.00	131.1	−6.8

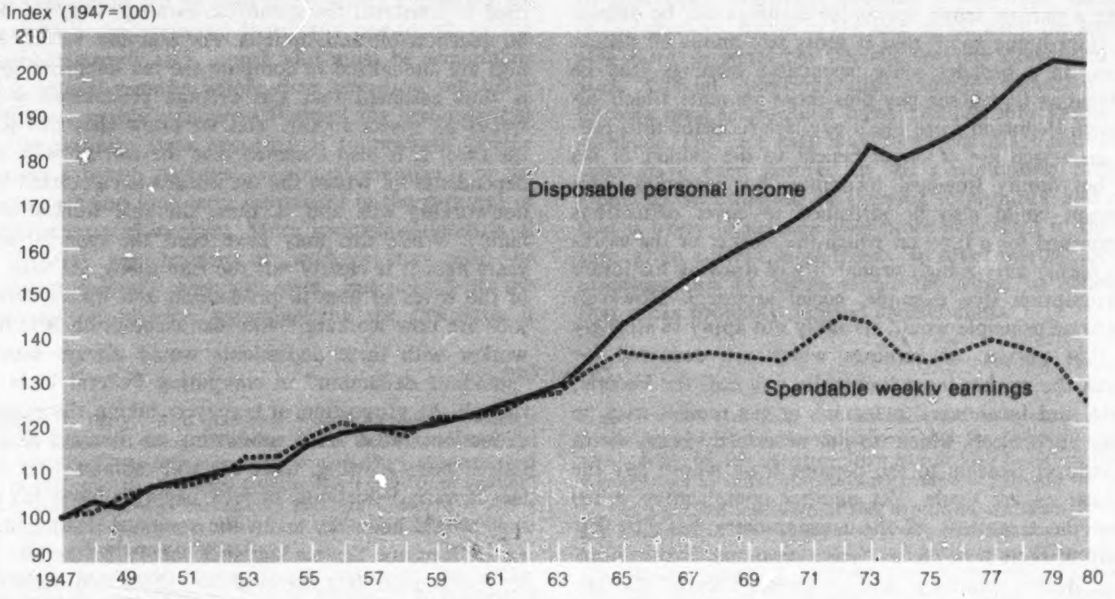
These data from the CPS highlight the importance of looking at the earnings trends of specific demographic groups. One is led to conclude from the data—the spendable earnings series notwithstanding—that the average worker with three dependents did not experience a decline in real earnings over the 1967–80 period. In fact, the data suggest that for these workers, who in most cases are in the 25 and over age group, earnings are most likely to have increased.

Per-capita income. A comparison of the trend in spendable earnings with the trend in "real per-capita disposable personal income"[10] reveals an even more striking divergence than do the above comparisons with CPS data. Chart 1 traces the course of the two series from the late 1940's to the end of the 1970's. Both series followed a similar upward trend until the mid-1960's, then each veered from its previous course, with the disposable income series rising faster than before and the spendable earnings series becoming very stagnant. Both series had accumulated gains of approximately 40 percent from 1947 to 1965. Over the next 15 years, the per-capita income series posted a further gain of 60 percentage points and by 1980 was slightly more than twice its 1947 level. In contrast, the spendable earnings series did not show any sustained growth after 1965, and in 1980, it actually dipped well below its mid-1960's level.

Several reasons for the sharp divergence between these two series were identified and quantified by Paul Ryscavage in 1979.[11] However, before examining those reasons, it is important to note the major definitional differences between the two series—spendable earnings relate to the average after-tax earnings of a specific group of workers; per-capita income relates to the average after-tax income from all sources accruing to all Americans, regardless of age or labor force status.

A paradox of the post-1965 divergence between the two series is that some of the factors which have given upward impetus to one acted as a drag on the other. For example, the increases in labor force participation

Chart 1. Trends in real per capita disposable personal income and real spendable weekly earnings of a worker with three dependents, 1947-80



SOURCE: Real per capita disposable personal income series, U.S. Department of Commerce.

of women and youth since the mid-1960's have added significantly to the aggregate earnings of American workers, and this, coupled with a decline in the rate of growth of the American population—primarily reflecting a drop in the birth rate[12]—has resulted in higher increases in per-capita income. But the impact on average weekly earnings has been just the opposite. Because many of the women and youth who joined the labor force since the mid-1960's work only part time, and because most are paid less than men even if working full time, their inflow into the labor force has kept average weekly earnings from rising as much as it would have had they not entered the labor force.

In other words, greater aggregate earnings has meant higher per-capita income but lower earnings per worker. Following is an illustration of this apparent anomaly:

> In a hypothetical family of four persons, the father is, initially, the only worker, earning $200 a week. This is the total family income, yielding a per-capita income of $50 a week. Suppose now that the father receives a 10-percent increase in pay, raising his earnings to $220 a week, and that the mother joins the work force, earning $80 a week in a part-time job. Total family income now rises to $300 a week and per-capita income jumps to $75. But look what happens to average weekly earnings per worker—it declines from $200 to $150. And if one of the children were to join the work force, per-capita income would increase again, while average earnings per worker would probably drop further.

The greater role of women and youth in the labor force has not been the sole cause for the sharp divergence between the disposable income and the spendable earnings series. The growing role of income transfer payments has also given a boost to the disposable income series. In addition, the disposable income series is translated into dollars of constant purchasing power using the Personal Consumption Expenditures (PCE) deflator. Hence, adjustments of the personal income series for inflation have been somewhat less severe than those which would have occurred had the Consumer Price Index been used as a deflator, as is done in the spendable earnings series.[13] But the main factors in the post-1965 parting of the series are those illustrated by the hypothetical family. In other words, much of the stagnation of the spendable earnings series is attributable to events which have resulted in increases in per-capita income.

Other issues

The statistical evidence and analogies presented in this article confirm that the series on spendable earnings for workers with three dependents has been underestimating both the level and trend in the earnings of such workers. But underestimation is not the only issue surrounding the series; there are also problems of conceptual and operational nature.

In a narrow sense, spendable earnings can be defined as "take-home pay," that is gross pay minus all deductions. In a broader sense, spendable earnings may be defined as take-home pay plus those amounts which, although deducted from one's pay, are funneled into programs which are of direct benefit to the worker or his or her family (medical insurance, for example). This concept could also be stretched to cover deductions earmarked for a fund on which the worker or the worker's family have a high probability of drawing for future consumption (for example, social security). However, the same principle would certainly not apply as strongly to that portion of earnings which are deducted (or which the worker must eventually pay out) for Federal, State, and local taxes, inasmuch as tax monies may be spent on projects which do not necessarily bring direct or indirect benefits to the persons from whose pay the deductions are made. Yet another complication arises from the treatment of the nonpecuniary benefits that many workers now receive (paid vacations, health insurance, dental insurance, and so forth). Clearly, the line between what is "spendable" and what is "not spendable" in terms of one's earnings is not at all obvious and raises many issues. Following is a discussion of some of these issues in light of the procedures which have been used to translate gross earnings into spendable earnings.

Deductions (or liabilities) for State and local taxes have not been considered in the spendable earnings computation. While these taxes were not very significant when the series was launched, they have grown rapidly in the post-World War II period. For example, in 1950, the average taxpayer paid less than 5 cents to State and local governments for each dollar paid to the Federal Government. But by 1980—"Proposition 13" and similar measures notwithstanding—the total personal income taxes paid to States and local municipalities had grown to 18 percent of the amount paid to the Federal Government.[14] And because the recently enacted reductions in Federal tax rates do not appear likely to be accompanied by similar declines in State and local rates, the above ratio is almost certain to grow in the future.

Thus, in addition to the crucial measuring problems, the fact that deductions for State and local taxes are ignored in translating gross earnings into spendable earnings raises a further question concerning the relevance of the spendable earnings series. Unfortunately, estimating such taxes at the national level would be exceedingly difficult, given that some States collect no personal income taxes and that most others have varying rates. Computation would be difficult even if the establishment-based earnings data were accompanied by currently nonexistent information on the family situation of each worker.

Even the computation of Federal income taxes, as used to construct the spendable earnings series, is based on questionable assumptions. For example, weekly earnings are annualized to compute the tax liabilities, and it is thus assumed that the average production worker works 52 weeks a year. Yet, we know that this is not the case. It is also assumed that the worker with three dependents for whom the tax burden is calculated has a nonworking wife and is, thus, the sole worker in the family. While this may have been the case 30 or 40 years ago, it is clearly not the rule today. At least half of the wives of men in production and nonsupervisory jobs are now working.[15] Another assumption is that the worker with three dependents would always take the "standard deduction" in computing Federal taxes. Although the proportion of taxpayers taking the standard deduction (rather than submitting an itemized list) has indeed been growing, there are still millions who do in fact itemize deductions, thereby paying a lower tax than they would had they taken the standard deduction. Internal Revenue Service statistics for 1978 (the last year for which such data are available) show that deductions were itemized in 40 percent of the returns with adjusted gross income ranging from $15,000 to $20,000—a bracket that would include many of the workers with three dependents. And, the higher the earnings brackets, the higher the percentage of returns with itemized deductions.[16]

A final question of conceptual nature is whether it is proper to treat a worker's contributions to social security as a tax. According to the U.S. Treasury Department, a tax is a "compulsory payment for which no special benefit is received in return."[17] Could this be said of social security contributions? Although compulsory for most wage and salary workers, these contributions are made with definite expectations of benefits to be received in the future. These contributions do, of course, reduce the portion of earnings that is immediately spendable, but so do deductions for medical insurance, life insurance, and so on, and these have not been considered as reducing spendable earnings.

Can 'spendable' earnings be measured?

Could an accurate computation of the "spendable" portion of the earnings of workers with three dependents (or any other number of dependents) be made if there were a reliable measure of the gross or pretax earnings of such workers?

Unfortunately, it is doubtful that a more useful and accurate spendable earnings series could be constructed from alternative sources of data, such as those from the CPS. The CPS provides valuable information on the earnings of individual workers and on the makeup of their families, and this information could be used to make more appropriate calculations of the tax burden of these workers. But the CPS data are subject to other limitations: they could not be used to construct a monthly series, as they are collected from only one-fourth of the household sample each month and must be accumulated for several months before their statistical reliability reaches acceptable standards. Perhaps the best role that the CPS earnings data can play is to provide reliable measures—based, perhaps, on annual averages—of the year-to-year and long-term movement in the earnings of specific groups of workers. More accurate estimation of the Federal tax burden of workers may also be attempted annually with CPS data. But even with the additional information accompanying the CPS data, it would be most difficult to accurately estimate State and local taxes—and this would remain a glaring deficiency in any meaningful measurement of spendable earnings.

IN SUMMARY, statistical evidence proves that, because of the gradual change in the mix of workers, the spendable earnings series has become severely downward biased. Crucial questions also emerge regarding the formula used to translate gross earnings into spendable earnings. The fact that deductions for State and local taxes have been ignored in the computation process looms as an omission of growing importance and one that is likely to become even more important in the future, given current fiscal trends. In other words, enough questions can be raised about the series to conclude that it has probably outlived its usefulness. ☐

Schwab, "Two measures of purchasing power contrasted," April 1971, pp. 3–14; Jack Alterman, "Compensation per man-hour and take-home pay," June 1971, pp. 25–34; Thomas W. Gavett, "Measures of changes in real wages and earnings," February 1972, pp. 48–53; and Robert L. Stein and Paul M. Ryscavage, "Measuring annual earnings of household heads in production jobs," April 1974, pp. 3–11.

[3] For a technical description of both of these series, see *BLS Measures of Compensation,* Bulletin 1941 (Bureau of Labor Statistics, 1977).

[4] Data on weekly earnings from the CPS were collected in May of each year from 1967 to 1978 (with the exception of 1968). Data on hourly earnings were collected each May from 1973 to 1978. Beginning in 1979, both weekly and hourly earnings data have been collected each month, with the weekly earnings data being published quarterly. For a detailed description of these data, see "Weekly and Hourly Earnings Data from the Current Population Survey," *Special Labor Force Report 195* (Bureau of Labor Statistics, 1977), and *Technical Description of the Quarterly Data on Weekly Earnings from the Current Population Survey,* Report 601 (Bureau of Labor Statistics, 1980).

[7] It should be noted that relative to the total number of workers, the number whose family includes a wife and two children under age 18 is relatively small. In the months for which the CPS data were studied there were, on average, 3.2 million such men with full-time production and nonsupervisory jobs in the private nonfarm sector. The average for the entire economy was 6 million.

[8] The only data on the demographic composition of the work force available from the establishment survey relate to the number of female employees, and even these data are not available separately for the production and nonsupervisory universe. But the decline in average weekly hours for this universe—from 38.8 in 1965 to 35.3 in 1980—is ample evidence of the increase in the number of part-time workers.

[12] The results of the 1980 census indicate that the rate of growth of the population may not have declined quite as much during the 1970's as had been previously thought. According to the Bureau of the Census, the actual population count for April 1980 was about 4.8 million higher than the estimate that had been carried forward from the 1970 census. The exact implications of this for the per-capita income series are not yet known, but the addition of 4.8 million persons to the denominator used in the computation of the series should, other things equal, result in downward revision of about 2 percent in the 1980 levels of the series.

Large supplies of meats, grains cut recent food price increases

Food prices helped to hold down the overall rate of inflation during the first half of 1981, although a resurgence took place in the third quarter; weather conditions and long-term production decisions are major factors in agricultural markets

WILLIAM THOMAS, JOHN WETMORE,
AND ANDREW CLEM

Food price increases accelerated to double-digit rates in 1978 and 1979, slowed somewhat through early 1980, then rose sharply during the second half of the year because of a severe summer drought. Price hikes were much more moderate through the first half of 1981, primarily reflecting the large output and lower feed costs of meat and poultry producers. However, increases accelerated again during June–September 1981, spurred by an upturn in meat prices.

The Consumer Price Index (CPI) for food rose at a 4.5-percent seasonally adjusted annual rate during the first 6 months of 1980, then surged at a 16.3-percent pace for the rest of the year. In the first half of 1981, however, food prices at retail edged up at a 1.0-percent annual rate. Price increases accelerated from June to September, as the CPI for foods recorded a 10.9-percent yearly rate of advance. (See table 1.) At the producer level, food prices declined somewhat in the first half of 1980, then rebounded at a 16.9-percent annual rate during the second half. From December 1980 to September 1981, the Producer Price Index for finished consumer foods slowed to a 3.0-percent yearly pace.

Food prices constitute 17.3 percent of the CPI for all items and 23.1 percent of the Producer Price Index for finished goods. Historically, food prices have been more volatile than other prices, alternately rising rapidly and contributing to inflation, then stabilizing or falling and thus moderating inflation. Food prices rose faster than non-food prices at both the retail and producer levels during 1978. Since the second quarter of 1979, they have risen more slowly than other prices in every quarter except for the third quarter of 1980 and, for the PPI only, the third quarter of 1981, when non-food producer prices showed their smallest increase since fourth-quarter 1972.

The following discussion focuses on some of the most significant price movements for foods and food-related commodities during the last 2 years. In some cases, we will refer to earlier periods to facilitate an understanding of the fundamental market forces underlying food price changes. Because many agricultural products normally follow multi-year production and marketing cycles, a longer term perspective enhances trend analysis. Seasonally adjusted data are used as a rule; however, unadjusted figures are cited where there is no stable seasonal pattern of price movement.

William Thomas, John Wetmore, and Andrew Clem are economists in the Office of Prices and Living Conditions, Bureau of Labor Statistics. Craig Howell, an economist in the same office, assisted in the preparation of this article.

Beef prices react to competition, weather

Beef and veal prices rose more than 20 percent in both 1978 and 1979. After declining at a seasonally adjusted 10.1-percent annual pace in the first half of 1980, the CPI for beef and veal climbed at a 22.8-percent rate from June to December. The index then fell at an annualized 14 percent through the first half of 1981. By the end of the third quarter, however, retail prices for beef and veal had turned up significantly, reflecting a surge in producer prices.

Processors' prices for beef and veal declined in 4 of the 5 quarters from December 1979 through March 1981; the exception was the third quarter of 1980, when searing summer heat damaged pastures and slowed cattle weight gains. Generally falling prices in 1980 and early 1981 reflected the large-scale liquidation of stock by cattle owners in the face of climbing interest rates and intense price competition from pork and poultry producers.

The U.S. Department of Agriculture estimates that the typical cattle production cycle lasts about 10 years —6 years of supply increases and 4 years of declines. Because it takes 28 months from the time a choice beef animal is bred to the time it is ready for sale, cattle producers cannot adjust to changing price and profit conditions as rapidly as poultry and pork producers. The last full cattle cycle began in the late 1960's, when cattle producers were encouraged by rising beef prices to boost production. This expansion resulted in a record U.S. stock of 132 million cattle in 1975. The subsequent liquidation of large cattle herds greatly affected the 1980–81 supply.

Table 1. Changes in retail and producer prices for selected foods, September 1979–81

Commodity and index	Relative importance, Dec. 1980	Percent change		Compound annual rate, seasonally adjusted except as noted, for 3 months ended —				
		Sept. 1979 to Sept. 1980	Sept. 1980 to Sept. 1981	1980		1981		
				Sept.	Dec.	Mar.	June	Sept.
Consumer foods:[1]								
CPI	100.0	10.1	6.5	19.7	13.1	2.1	-0.1	10.9

Sugar and sweets:[3]								
CPI	2.9	28.0	.1	33.8	39.5	-11.1	-25.0	8.0
PPI	4.8	57.2	-27.7	21.2	-1.9	-37.6	-28.6	-37.5
Roasted coffee:[2]								
CPI	.8	0	-19.0	-5.7	-30.0	-27.7	-6.8	-8.8
PPI	3.6	-6.2	-11.6	-20.2	-21.0	-1.8	-22.7	1.9

[1] Includes items not listed. The CPI includes prices of food away from home, which accounts for about 31 percent of the food index. The PPI for finished consumer foods does not reflect restaurant prices.

[2] Not seasonally adjusted in the CPI.

[3] "Sugar and confectionery" in the PPI. Not seasonally adjusted in the PPI.

NOTE: Monthly data for the PPI have been revised through May 1981 to reflect the availability of late reports and corrections by respondents. For this reason, some of the figures shown above and elsewhere in this report may differ from those previously published.

In 1980, beef production was 1 percent above year-earlier levels, the first over-the-year advance since 1976. (See table 2.) This resulted from a 0.4-percent increase in cattle slaughter and, more importantly, a record-setting average dressed beef carcass weight[1] of 635 pounds. Dressed slaughter weights were relatively large in the first half of 1980, averaging nearly 643 pounds. Because the market for fed cattle was slow, many of these animals were over-finished when they were finally sold. At the same time, favorable weather conditions contributed to relatively heavy weights for nonfed slaughter cattle. The average dressed weight in the second half of 1980 fell to 628 pounds, in large part because of the drought, but had recovered to nearly 645 pounds by September 1981.

The pattern of price change for live cattle was about the same as that cited earlier for beef and veal at the processor level. Prices fell during most of 1980, except during the summer when the heat drove up grain and feed prices. Record interest rates further increased production costs late in the year. However, a glut of pork and poultry prevented beef prices from rising enough to cover these cost increases. Feedlot owners also operated at a loss during the year, despite falling prices for the cattle they purchased for fattening.

During the first half of 1981, an unusually high average dressed weight of nearly 644 pounds held beef production above the corresponding 1980 level. And, while the slaughter of fed animals declined slightly from 12.1 million head in 1980 to 11.9 million in 1981, there was a sharp rise, from 1 million to 1.6 million, in nonfed slaughter as a result of inadequate grazing capacity. Large supplies of other red meats and poultry, coupled with a sluggish economy, also contributed to lower prices for cattle during the first quarter. However, during the second quarter of 1981, the prices of slaughter animals turned up as supplies of both hogs and cattle declined, and demand by beef packers improved.

Pork prices follow beef trends

Like beef and veal prices, retail pork prices fell in the first half of 1980, climbed rapidly in the second half, and declined through May 1981 before turning up in the third quarter. They decreased sharply during periods of abundant supplies even though consumers were substituting pork for more costly beef. Prices surged in mid-1980, when intense summer heat resulted in slow weight gains and a large number of hog deaths.

The pork market in 1980–81 was very volatile, generally characterized by large supplies and increased production costs. During the 1970's, most years had been profitable for pork producers; the pork production cycle (9 to 10 months) is considerably shorter than the cattle cycle, and permits more rapid adjustments to changing market conditions. But while the domestic inventory of hogs and pigs shrank for the first time in 4 years, the 64.5 million head count as of December 1980 was still relatively large. Thereafter, pork production remained high despite operating losses. At the same time, burdensome interest rates discouraged storage of meat, adding to already ample supplies.

The changing character of the industry in recent years has greatly influenced prices, as well as breeding and marketing decisions. There appear to be divergent interests between large producers, with temperature-controlled piggeries and other sophisticated equipment, and smaller farmers, who face more severe credit and cost problems. The relatively high fixed capital costs incurred by larger producers constitute an incentive for them to maintain output even in the face of higher operating costs. During 1977, producers with 500 or more hogs accounted for 35.3 percent of total production; by 1980, this share had increased to 42.3 percent. Future retail pork prices will also be greatly influenced by those packers who are marketing boxes of vacuum-packed chunks; this practice, pioneered by beef packers, reduces the need for butchers in retail outlets.

Poultry producers have flexibility

The poultry component of the CPI declined at a seasonally adjusted annual rate of 8.5 percent in the first half of 1980, then turned up at a 44.4-percent yearly pace in the second half. The 1980 summer heat affected chickens much more than other livestock, and millions of chickens died. During he first half of 1981, retail poultry prices decreased at a 15.2-percent annual rate, but rebounded at an annualized 13 percent over the quarter ended September 1981.

The poultry production period is even shorter than the pork cycle. Because the time from fertilization to market-ready chicken is only about 11 weeks, poultry farmers can respond quickly to changing market conditions. However, in anticipation of a cutback in pork supplies, poultry producers have expanded operations in recent years, even in the face of unfavorable prices. For example, during the spring of 1981, producers estimated that they were losing as much as 12 cents per chicken sold, largely because of earlier increases in the costs of grains and energy. Nonetheless, broiler production in the first half of 1981 was 4 percent above that for the same period in 1980.

Table 2. Annual commercial production of beef, pork, and chicken broilers, 1971–81
[In millions of pounds]

Year	Beef	Pork	Broilers
1971	21,697	14,606	7,724
1972	22,218	13,460	8,147
1973	21,088	12,578	8,025
1974	22,844	13,583	8,126
1975	23,673	11,314	8,127

Grains, oilseeds, and animal feeds

Prices for grains and feeds turned down in 1981, following 3 years of general increase. Even soybean prices, which had displayed no clear trend in recent years, began to fall sharply in late 1980 and continued to edge down in most subsequent months. (See table 3.) This widespread easing of crop prices reflected both short-term influences, such as good weather and weak export demand, as well as long-term cyclical factors.

The 1970's witnessed a tremendous expansion of world trade in grains and oilseeds. The share of U.S. farm cash receipts accounted for by exports grew from an average of 13.9 percent in the 1960's to 22.1 percent during the 1970's. By 1980, this proportion was approaching 30 percent. As a result, farm prices have become increasingly sensitive to conditions abroad.

Export demand boosts prices. During the summer of 1972, the Soviet Union purchased massive amounts of American grain to alleviate a drought-related shortage. Wheat prices climbed rapidly as a result, and by January 1974 were 4 times their June 1972 level. The reaction in the corn market was more delayed; prices began to rise in late 1972, then tripled over the next 2 years. The declining exchange value of the U.S. dollar during this time further stimulated foreign demand for grains and soybeans, and consequent price increases.

The explosion of grain prices during 1972–74 pushed up prices for bread, animal feeds, livestock, and meats; this ultimately translated into a substantial increase in the overall rate of inflation. As a result, U.S. farm policy, which historically had been directed toward limiting acreage planted, disposing of chronic surpluses, and supporting prices, was modified to encourage farmers to maximize crop production. This move and the incentive of higher crop prices did lead to bigger domestic harvests. Soon, however, harvests abroad also improved, grain markets were swamped with excess supplies, and wheat and corn prices tumbled from late 1974 through the summer of 1977. During the latter year, the government reinstated price supports, and initiated a new program to help farmers purchase their own grain storage

Table 3. Changes in producer prices for grains, feeds, and livestock, 1979–81

Grouping	Percent change		Compound annual rate, seasonally adjusted except as noted, for 3 months ended —				
	Sept. 1979 to Sept. 1980	Sept. 1980 to Sept. 1981	1980		1981

[1] Not seasonally adjusted.

[2] Data not available.

facilities. It was hoped that by enabling farmers to withhold their crops from the market in times of low prices, the new program would help to stabilize prices and farm earnings in the future.

The recent years. Wheat and corn prices reversed their slide and began to rise substantially in late 1977, as poor overseas harvests and the declining value of the dollar again boosted sales and commodity prices. In response, farmers devoted more acreage to wheat and corn during 1978–81. (See table 4.)

For the most part, soybean prices moved independently of grain prices during the second half of the 1970's. Because U.S. soybean exports faced increased competition from Brazilian products, the large upward trend in corn and wheat prices during 1978–80 was not followed by soybeans.

Prices for grains and oilseeds turned down somewhat in late 1979 and early 1980 because of good harvests. However, the drought in mid-1980 caused severe damage to corn and soybean crops; total production and per-acre yields for both were nearly one-fifth below year-earlier levels. During third-quarter 1980, prices for corn advanced 31 percent and for soybeans, 47.6 percent. Because most of the winter wheat crop (which accounts for about 70 percent of total annual wheat production) had already been harvested by summer, and the remaining spring wheat fields were not affected as badly by the drought, wheat prices rose considerably less than those for other grains and oilseeds.

The sharp increase in animal feed prices during the third quarter of 1980 reflected both reduced harvests of the commodities from which they are manufactured and the damage caused to pasture lands by the intense summer heat. However, feed prices turned down in late 1980 and early 1981, in part because the relatively mild winter in livestock feeding areas dampened demand.

From late 1980 through the spring of 1981, prices for wheat and corn generally receded. A reduction in export demand resulted from the appreciation of the U.S. dollar in currency markets. At the same time, exceptionally high interest rates, which discouraged speculation in grain markets and induced firms to minimize their holdings of grain, lessened domestic demand. Soybean prices likewise decreased over this period, for similar reasons. However, the rate of descent was much steeper than that for grains, because bumper harvests in Brazil glutted the world market. A further negative impact on grain, soybean, and feed prices was the above-mentioned weakened demand for animal feeds.

Weather was relatively moderate during the summer of 1981, and rain was sufficient to permit steady growth. Prices for grains, oilseeds, and feeds plummeted as harvest estimates were raised throughout the summer. The latest statistics available indicate record production of wheat and corn, reflecting both increased area planted and higher yields per acre. Corn prices fell very sharply during the third quarter; wheat prices also declined, although not as rapidly. The soybean harvest was greater than in 1980, although smaller than in 1979, and prices edged down only slightly from June to September. Nevertheless, by the close of third-quarter 1981, prices for wheat, corn, and soybeans were almost as low as those prevailing before the 1980 summer drought.

Sugar prices reflect changing consumption patterns

The United States imports over a third of its sugar. A complex series of price supports and loan programs, combined with tariffs and duties, normally keeps domestic sugar prices above world prices. But because these supports constitute a floor rather than a ceiling, any large increases in world prices are quickly reflected in domestic markets.

Table 4. Selected production statistics for wheat, corn, and soybeans, 1976–81

Year	Area planted (million acres)			Area harvested (million acres)			Yield (bushels per acre)			Total production (million bushels)

Source: U.S. Department of Agriculture, *Agricultural Outlook*, October 1981.

Twice in the last decade world sugar prices have soared, only to plummet almost as rapidly. The principal cause of the 1974 run-up in prices was a failure of production to keep pace with demand; in 1980, the major factor was a sharp drop in production. Because sugar is a key ingredient in many processed foods, it has a broader impact on food prices than its direct consumption would indicate.

World sugar consumption grew every year for two decades prior to 1974 because of general population growth, and rising living standards in many Third World countries. However, sugar production increased more erratically. Despite record output in 1973 and 1974,[2] world stocks were lower at the end of the crop year in 1974 than in 1970. More significantly, stocks as a percentage of consumption fell sharply from 29.3 percent to 21.9 percent over the 1970–74 period. (See table 5.)

The shrinkage of stocks relative to consumption led to a doubling of world raw sugar prices from June 1971 to June 1973 to their highest level since 1964. Prices exploded in 1974, quintupling by year's end. Domestic prices rose more slowly at first as duties were lowered, but then climbed with world prices. However, by late 1974 it was clear that 1975 sugar production would not be as low as originally feared and total world consumption had declined for the first time in decades. As a result, prices fell sharply during the first half of 1975, although they remained above the 1973 level.

World production set new records each year from 1976 to 1978, and stocks became more closely aligned with consumption. Thus, a slight decline in production in 1979 did not seriously affect prices. In 1980, however, there was a sharp drop in output, reflecting poor harvests in several countries (most notably Cuba and the Soviet Union), and prices for raw sugar soared. World prices tripled from their 1979 level; domestic prices only doubled, however, owing to decreases in the level of import fees. In 1981, the world crop was slightly larger, but stocks fell again, this time to their lowest level since 1976 (the lowest since 1974 when expressed as a fraction of consumption).

Even so, a number of factors caused prices to start falling by the end of 1980. World consumption declined in response to higher prices and increased use of sugar substitutes. At the same time, high interest rates and predictions of sizable output in 1982 discouraged speculation and the holding of large inventories, and many commercial users allowed their own buffer stocks to run down. Prices fell throughout the first three quarters of 1981, finally reaching early-1980 levels. Domestic prices followed the world price downward until import fees were resumed in mid-September.

As previously indicated, a peculiarity of the sugar market is the fact that close substitutes are available, the most important of which are corn syrups. Because the capacity to produce substitutes is fixed in the short run, their prices tend to rise and fall in tandem with that of sugar. However, the increased use of other sweeteners is apparently contributing to a long-term decline in per capita sugar consumption in some industrialized nations, such as the United States, Canada, and Japan, although consumption is still increasing in the Third World.

World markets determine cocoa prices

Because the United States imports all of its cocoa beans, the domestic price is determined by the world price. A small number of tropical countries are responsible for most of the world supply. The International Cocoa Agreement, designed to control supplies and prices, does not include either the Ivory Coast—currently the world's largest exporter—or the United States—the world's largest importer. Consequently, world prices depend primarily on market conditions.

World production of cocoa beans fluctuated widely over the last 10 years. Harvests were especially small in 1973 and 1977,[3] boosting prices to new highs from which they never fully retreated. Production increased sharply from 1978 through 1981, with new records set in each of the last 2 years. As a result, prices declined sporadically from their late 1977 peak. Over the same period, consumption lagged behind production, and surpluses were recorded in every year since 1978; in particular, U.S. per capita consumption fell by almost a fourth from 1972 through 1977, and remained near the

1977 level through 1980. Over the years, periods of high cocoa prices have encouraged a gradual switch to chocolate substitutes. Consumption was further discouraged during 1980 by the rapid rise in the price of sugar, an important ingredient in most products containing cocoa.

Cocoa bean prices fell during most of 1980. Stocks reached record levels in 1981, and by June prices had fallen to their lowest level since 1976. The 1982 harvest, forecast to be large, may lead to the fifth consecutive year of surpluses, despite recent increases in per capita consumption in response to lower prices for both sugar and cocoa. Nevertheless, speculation regarding renewed efforts by the International Cocoa Agreement signatories to support prices caused an upturn in prices in the third quarter of 1981.

Coffee price trends

The United States imports virtually all of its coffee, 75 percent of which comes from Latin America. Therefore, the domestic price at the producer level follows the world price. Although there is an International Coffee Agreement, it is generally regarded as ineffective in moderating price swings as the supply situation changes. Consumers do not often see the effects of world price developments immediately because of long time lags as green coffee beans move from stockpiles to roasters. And the frequent use of coffee as a loss leader in retail stores also helps to divorce consumer price trends from producer price movements.

World coffee prices showed only moderate fluctuations during the early 1970's. However, in mid-1975, a number of developments adversely affected the world coffee crop. Most notable were a severe frost in coffee-producing regions of Brazil, which reduced that nation's 1976 output by 60 percent,[4] and civil war in Angola, which resulted in a long-term 75-percent drop in production. With supplies curtailed, coffee prices registered sharp increases until 1977, then declined until another, much less severe Brazilian frost in 1979 caused a brief surge. Prices fell to the 1979 pre-frost level during 1980 and the first half of 1981, as supplies again became plentiful. Another frost in Brazil during July 1981, although potentially severe, will not affect production and prices until the 1982 harvest.

Table 5. Selected global sugar statistics, annual world production, consumption, and stocks of sugar, selected years, 1965–82

[Million metric tons, raw value]

Crop year[1]	Production	Consumption	Ending stocks	Ending stocks as a percent of consumption
1965	64.5	58.3	16.6	28.5

1982[2]	95.8	92.0	25.1	27.3

[1] Crop year September through August, but includes the sugar harvests of several Southern Hemisphere countries which begin before September.

[2] Data are preliminary.

Source: U.S. Department of Agriculture.

Domestic per capita coffee consumption declined by nearly 40 percent from 1962 through 1981, while soft drinks, tea, and juices increased in popularity. Coffee consumption dropped sharply in 1977 because of high prices, recovered for 2 years, then resumed its downward trend in 1980. By 1981, it had reached its lowest level since records were started in 1950. ☐

FOOTNOTES

[1] A glossary of some of the technical terms used in this section:

—*Dressed beef carcass weight* represents the weight of slaughtered animals after removal of hides, hoofs, and internal organs.

—*Fed* or *feeder cattle* are animals given a diet of grains and formula feeds while in feedlots to enhance meat quality prior to marketing.

—*Nonfed cattle*, commonly called grass-fed cattle, are those that graze in crop fields already harvested or in pastures.

—*Over-finished cattle* are fed cattle with a high fat-to-meat ratio.

Scheduled wage increases and cost-of-living provisions in 1982

Deferred increases will average 6.3 percent, more than in any year since 1971, and are payable to 4.3 million workers; approximately 3.4 million may receive cost-of-living adjustments

DOUGLAS R. LEROY

In 1982, about 4.3 million workers in private industry are scheduled to receive wage increases under major collective bargaining agreements[1] that were negotiated in earlier years. These "deferred" increases will average 6.3 percent—the highest average recorded since 1971 (7.7 percent). About 3.4 million workers covered by agreements that will be in effect during part or all of 1982 may anticipate wage changes from cost-of-living adjustment clauses. Some 2.3 million of these workers will also receive deferred increases. About 3.7 million workers will be covered by contracts expiring or with provisions for reopening in 1982, making this a relatively heavy bargaining year.[2]

This article focuses on deferred wage increases and cost-of-living adjustments (COLA) provided by the major agreements that will remain in effect through 1982. The analysis of deferred increases does not include contracts covering 1.2 million workers which expired before 1982, but had not been renegotiated or for which data were not available at this writing.[3]

Deferred wage increases

Deferred wage increases are those that are implemented in one calendar year but had been negotiated in an earlier year, usually as part of a multiyear agreement. They include general wage adjustments covering all workers, and changes which affect only a portion of the bargaining unit such as those that alter skill differentials or premiums.

The comparatively large mean deferred wage increase in 1982 results from increases negotiated during 1981, which averaged 8.5 percent and covered 1.3 million workers. Deferred increases from contracts negotiated during 1980, which covered 2.9 million workers, averaged 5.1 percent.

The proportion of workers with cost-of-living provisions in their contracts influences the size of average deferred increases—contracts with COLA clauses generally provide smaller deferred wage increases than those without. Cost-of-living provisions covered only 21 percent of the workers under settlements reached in 1981, compared with 61 percent of those under 1980 settlements. Workers covered by 1981 agreements with COLA will receive average deferred increases of 5.9 percent in 1982, compared with 9.3 percent for those without such clauses.

The size of deferred increases varies significantly by industry and prevalence of COLA. For example, the largest increases, in both cents-per-hour and percentage terms, will occur in the construction industry, where COLA clauses are rare. About 1 million construction

---

Douglas R. LeRoy is an economist in the Office of Wages and Industrial Relations, Bureau of Labor Statistics.

workers are scheduled to receive average deferred wage increases of 10.6 percent or $1.52 per hour in 1982.[4] The 159,000 construction workers covered by contracts with COLA clauses will receive deferred increases averaging 7.5 percent, compared with 11.2 percent for the 869,000 workers under contracts without cost-of-living provisions.

The metalworking industries, where COLA clauses cover 90 percent of the workers, have deferred increases averaging only 3.1 percent, or 32.1 cents per hour, for 1 million workers in 1982. (See tables 1 and 2.) For the 2.7 million workers with COLA coverage, the average deferred increase is 2.7 percent, compared with 6.6 percent for the remaining 92,000 workers.

Table 3 shows distributions of workers receiving deferred payments by month during 1982. In August, the month with the greatest concentration, 1.2 million workers, 80 percent of whom are in the steel manufacturing and telephone communications industries, are scheduled for increases.

[1] Includes workers in the following industry groups for which separate data are not shown: tobacco (22,000); textiles (12,500); apparel (18,000); furniture (13,000); printing (37,000); petroleum refining (2,000); chemicals (32,000); rubber (4,000); leather (33,000); instruments (25,000); and miscellaneous manufacturing (6,000).

[2] Includes 199,000 workers in mining industry for which separate data are not shown because of concerns on the confidentiality of earnings data, and 23,000 workers in the financial, insurance and real estate industries.

[3] Percent of straight-time average hourly earnings.

NOTE: Workers are distributed according to the average adjustment for all workers in each bargaining unit considered. Deferred wage increases include guaranteed minimum adjustments under cost-of-living clauses. Only bargaining units in the private, nonagricultural economy covering 1,000 workers or more are considered in this table. Because of rounding, sums of individual items may not equal totals. Dashes indicate there are no workers having wage increases that fall within that stated range.

In general, multiple year contracts tend to provide higher wage changes in the initial years than in subsequent years. For instance, 3-year agreements negotiated in 1981 provided average adjustments of 11.3 percent during the first year, 8.3 percent in the second year, and 6.8 percent in the third.

Cost-of-living adjustments

Fifty-six percent of workers covered by major agreements have cost-of-living protection. Two-thirds of the workers with COLA clauses will have at least one review during 1982.[5] (See table 4.) COLA provisions are designed to help workers recover purchasing power lost through price increases. The number of workers receiving COLA increases and the proportion of purchasin power actually recovered under individual bargainin agreements depend on the specific formula used to r late wage and price increases, the timing of COLA r views, and possible "caps" limiting the amount of COL payments. Through the first 9 months of 1981, cost-o living adjustments returned about three-quarters of th rise in the Consumer Price Index (CPI).

The number of workers affected by COLA clauses ha been decreasing since 1977, largely because of emplo ment declines in industries where such clauses are con mon. The slightly larger than proportionate drop COLA coverage in 1978, resulted from the elimination the COLA provision from the bituminous coal contra

Dashes indicate absence of cost-of-living coverage.

The following tabulation shows the total number of workers and those under cost-of-living clauses (in millions) on January 1, 1971–82:[6]

	Workers			*Workers*	
Year	*With COLA*	*All*	*Year*	*With COLA*	*All*
1971	3.0	10.8	1977	6.0	9.8
1972	4.3	10.6	1978	5.8	9.6
1973	4.1	10.4	1979	5.6	9.5
1974	4.0	10.2	1980	5.4	9.3
1975	5.3	10.3	1981	5.3	9.1
1976	6.0	10.1	1982	5.1	9.0

Five unions account for 57 percent of the workers under major agreements with COLA clauses. The Automobile Workers represent 962,000; the Communications Workers, 609,000; the Teamsters, 513,000; the Steelworkers, 486,000; and the Machinists, 310,000. Each of the remaining unions represents fewer than 200,000 workers with cost-of-living provisions.

Adjustment formula. The most common rate of adjustment is 1 cent per hour for each 0.3-point rise in the CPI. Members of the Steel Industry Coordinating Committee[7] and companies which follow the steel contract pattern use this formula.

In addition, the 1979 Automobile Workers agreements provided COLA payments at this rate using a combined U.S.-Canadian index for the first 2 years, but changed the formula to 1 cent for each 0.26-point rise at the beginning of the 1981 contract year. COLA clauses in rubber industry contracts provide 1 cent for each 0.26-point increase in the CPI beginning in 1981, the second year of the agreements. The Bell System operating companies and manufacturing firms that follow their contract pattern specify changes of 55 cents per week plus 0.65 percent of each employee's weekly rate for each 1-percent movement in the CPI.

Table 3. Workers receiving deferred increases in 1982 in bargaining units covering 1,000 workers or more, by month

[Workers in thousands]

Effective month	Principal industries affected	Workers covered
Total		[1]4,295
January	Construction	331
February	Metalworking	169
March	Metalworking, trade	276
April	Construction, metalworking, food stores	275
May	Construction	455
June	Mining, construction	795
July	Construction, utilities, food stores	547
August	Primary metals, communications	1,204
September	Mining, food stores	339
October	Transportation equipment	292
November	Construction	133
December	Mining	254

[1] This total is smaller than the sum of individual items because 775,000 workers will receive more than one increase. This total is based on data available as of Oct. 1, 1981, and thus may understate the number of workers receiving deferred increases for the entire year.

Timing, "caps", and indexes. COLA clauses provide reviews of changes in the CPI at regular intervals to deter-

Table 4. Timing of 1982 cost-of-living reviews in major contracts, by year of contract expiration and frequency of review

[Workers in thousands]

[1] Includes only those reviews through the termination of the present agreements; does not assume the continuation of existing reviews after contract expiration dates.

[2] Includes monthly, combinations of annual and quarterly, combinations of annual and semiannual, and reviews dependent on levels of the Consumer Price Index.

[3] Contracts that have at least one review in the year.

NOTE: Dashes indicate data not available.

mine if there are to be wage adjustments. Quarterly reviews are the most common; they cover 2.1 million workers, including those in the steel and automobile industries. Annual reviews affect 1.6 million workers, most notably in communications—Bell System agreements provide for reviews in August 1982. Semiannual reviews cover nearly 1.3 million workers, including more than 400,000 workers each in the railroad and trucking industries; in both industries, the frequency of review was changed from annual to semiannual in the 1978 and 1979 agreements.

"Caps", or maximum limits may also affect the amounts of cost-of-living adjustments. Slightly more than 1.1 million workers have such caps in their contracts. Currently, the largest single group with limits on COLA adjustments are the 400,000 workers in the railroad industry.

In addition, the amounts of cost-of-living increases are affected by the index used in the formulas. Contracts covering about 80 percent of the workers under COLA provisions use the BLS Consumer Price Index, U.S. "all cities" average. About 265,000 workers are under contracts with clauses using individual city indexes. Automobile industry contracts, covering 695,000 workers, use a combination of the U.S. and Canadian indexes because bargaining units in both countries are involved.

Minimums or "guaranteed COLA", which provide a "floor" for the size of wage change under the provision, cover 547,000 workers. These amounts are negotiated at the time the contract is agreed upon and do not depend upon CPI movements. Therefore, they are included in our tabulations as specified wage changes.

GIVEN THE CURRENT economic climate, it is possibl that some of the increases discussed above will not b implemented as scheduled. During 1981, there were a number of contract reopenings that provided for suspension of COLA provisions, wage decreases, or delays in instituting previously negotiated increases. □

FOOTNOTES

[1] Major collective bargaining units are those which cover 1,000 workers or more in the private nonfarm sector.

[2] For an analysis of the bargaining schedule for 1982, see Mary Anne Andrews and David Schlein, "Bargaining calendar will be heavy in 1982," *Monthly Labor Review*, December 1981, pp. 20–30.

[3] These units include 870,000 workers covered by 185 agreements which expired or reopened prior to Oct. 1, 1981, but for whom settlements were not reached or for which information was not available in time to be included in these tabulations. About half of these workers were in railroad industry agreements. Another 284,000 workers were covered by 108 agreements expiring or reopening between Oct. 1 and Dec. 31, 1981, after the closing date for this article.

[4] About 481,000 construction workers will receive deferred increases under settlements in which the parties agreed to a total wage and benefit package, with the final allocation between wages and benefit to be determined by the union. Because the final division was no known at the time this article was prepared, the entire package ha been treated as a wage increase and may be overstated.

Organized labor in 1981: a shifting of priorities

The quickened pace of wage-and-benefit concessions and employment declines in major industries left organized labor with little to celebrate in its 100th year; these factors made labor and management more aware of the cooperation needed to resolve mutual problems

GEORGE RUBEN

The organized labor movement was 100 years old in 1981, but the celebration was muted by continuing difficulties in attracting workers to the movement, by employment cutbacks in some heavily unionized industries, and by disagreements with the Reagan Administration over social and economic policies. Opposition to Administration policies culminated in a September "Solidarity Day" rally of 400,000 workers in Washington, D.C., to publicize labor's grievances. And, in a break with tradition, the AFL-CIO did not invite the President to attend its annual convention. Shortly afterwards, in December, President Reagan met with AFL-CIO President Lane Kirkland and other labor leaders in an effort to improve relations, with mixed results. Kirkland agreed to help in attaining closer consultation on labor matters, but said that organized labor would continue to oppose the President's economic program.

The steel industry rebounded somewhat from its 1980 operating losses, but economic difficulties continued in the automobile and automobile parts, trucking, rubber, construction, and airline transportation industries. One consequence was an increase in the number of settlements calling for employee "sacrifices"—wage-and-benefit reductions or deferrals. The only beneficial aspect of these somber developments was an increased awareness by labor and management of the need to cooperate in countering mutual problems, such as foreign competition, energy shortages, and plant and product obsolescence. In some cases, this cooperative spirit was manifested by the establishment of formal bipartite committees that would continue after immediate difficulties are resolved.

There was some moderation in the inflation rate, but the unemployment rate increased as the economy entered a recession in the second half of the year. The voluntary program of wage and price restraints, initiated by the previous Administration, was ended in January. President Reagan said the program was "totally ineffective in controlling inflation" and that it "imposed unnecessary burdens on labor and industry." The Council on Wage and Price Stability, administrator of the program, generally agreed with the President's assessment, but said that the program had been successful in "preventing a bad situation from becoming even worse."

Auto industry's problems continue

Although 1981 was a "nonbargaining year" for the major automobile manufacturers, at Chrysler Corp., the Auto Workers and other unions agreed to wage-and-benefit concessions to aid the beleaguered company. General Motors Corp., Ford Motor Co., and American Motors Corp. also pressed the Auto Workers to reopen their contracts, contending that immediate reductions in labor costs were needed to compete effectively with Chrysler and foreign manufacturers. The union maintained that these companies were in better financial condition than Chrysler and would have to await the

1982 contract bargaining to present their demands. However, late in the year, the Auto Workers agreed to start the 1982 bargaining earlier than usual. Union president Douglas Fraser said the decision was impelled by the deteriorating condition of the industry. General Motors and Ford (and Chrysler) contracts expire in September 1982 and American Motors' contract, in 1983.

In December of 1980, Chrysler submitted a wage concession plan to the Auto Workers and the other unions to enable the company to qualify for another $400 million in Federal aid under the Chrysler Corporation Loan Guarantee Act of 1979. The company lost $1.77 billion in 1980, and $1.1 billion in 1979. Lee A. Iacocca, chairman of Chrysler's board of directors, predicted that Chrysler would be bankrupt in February 1981 without an infusion of money. This impelled intensive negotiations in which Auto Workers' members agreed to $622 million in wage-and-benefit reductions, in addition to the $446 million in reductions (from the General Motors and Ford settlement pattern) the union had accepted in November 1979 and January 1980. The severity of the concessions could be reduced as a result of the company's commitment to negotiate profit-sharing and stock-ownership plans.

The wage concession plan approved by the Chrysler Loan Guarantee Board specified that Chrysler "take all possible steps" to get additional capital. This led to some merger talks between Ford and Chrysler, but Ford directors decided that a merger was contrary to "the best interests of Ford and its stockholders."

Some Auto Workers locals bargained with General Motors and Ford on the issue of "excessive" labor costs. In addition, the union engaged in unscheduled bargaining with several parts suppliers who sought pay concessions because of operating losses attributed to the automobile sales slump:

- At Ford's steelmaking operation in Dearborn, Mich., the Auto Workers agreed to an 86-cent-an-hour cut in earnings of incentive employees. This averted a planned cessation of steel sales to outside users, which would have resulted in the termination of 3,200 of the plant's 5,000 hourly workers. Ford said the pay cut was necessary because its "contractual" labor costs was 30 percent higher than those of competing steel companies.
- Ford gained efficiency-increasing changes in work rules at several plants, including Livonia and Sterling Heights, Mich., and at a stamping plant in Cleveland, Ohio, and it was seeking changes at a number of other locations. The work rule changes included the scheduling of overtime work and the ratios of inspectors and machine set-up workers to production workers. After the concessions, Ford announced a $1-billion project to convert the two Michigan plants to produce transmissions. A company official said that the changes in work rules had enabled the two plants to underbid Tokyo Kogo (which is 25 percent owned by Ford) for the production contract.
- Possible closing of a General Motors roller bearing plant in Clark, N.J., was averted when employees agreed to purchase the operation. The employees also agreed to a 25-percent reduction in compensation, which would be partly offset by a distribution of stock shares to employees and by possible monthly and semiannual payments based on the plant's output.

As the year closed, there was no relief in sight for the auto industry, as sales continued at a substantially lower rate than in 1980. Ford, Chrysler, and General Motors reported a combined loss of more than $950 million for the third quarter. The situation was particularly acute at Chrysler, where the loss was $149 million, instead of the $38 million the company had forecast in the survival plan approved by the loan guarantee board.

Steel industry rebounds

Most of the Nation's steel producers operated at a profit during 1981, after suffering losses in 1980. At U.S. Steel Corp., the turnaround was attributed to the closing of inefficient plants and the revamping of others, and to the completion of some required antipollution measures.

The biggest question in the industry's relationship with the United Steelworkers was the status of the Experimental Negotiating Agreement. The agreement, which prohibited the union from striking over economic issues in return for a "floor" under each wage and benefit settlement, was first negotiated in 1973 and was renewed in each subsequent settlement, but not in 1980. This means that the union can strike when the current 3-year wage-and-benefit contract expires in 1983, and that any 1983 settlement would not be subject to the economic floor.

The delay on the fate of the Experimental Negotiating Agreement apparently resulted from management's concern that the floor under economic settlements might be too high a price to pay for the operating economies resulting from a strike-free relationship. Specifically, management was concerned that the required minimum increase in compensation in each contract year (an amount equal to 3 percent of average straight-time hourly earnings) and the required retention of an uncapped cost-of-living clause had helped to widen a labor cost disparity with foreign producers. Despite these misgivings, the parties did conduct intermittent talks on the agreement.

Even though the fate of the Experimental Negotiating Agreement was uncertain, there were instances of a cooperative approach to mutual problems. The latest effort consisted of Labor-Management Participation Teams set up in the plants of five companies under provisions of the 1980 agreement. The aim of the experimental teams is to increase productivity and improve working conditions through better communication and cooperation between supervisors and employees.

In addition, the Steelworkers pressed for reactivation of the Steel Tripartite Advisory Committee that had been established in 1978 to seek solutions to problems of capital formation, trade, technology, environment, and community assistance. President Carter had announced a national steel policy based on recommendations of the committee, but some aspects were not enacted prior to the end of his term of office.

Despite improved performance in 1981, several major companies were planning to sue some European steel producers for allegedly engaging in unfair practices, such as selling in the United States at prices below their production costs. The Department of Commerce initiated unfair trade charges against 5 countries, asserting that they had subsidized steel produced for export to the United States.

Analysis of 'new' contracts

Postal Service—change in approach. In terms of the number of workers involved, the major 1981 settlements involved the U.S. Postal Service, which bargained with four unions representing 600,000 employees. The talks were scheduled to start in April, 3 months before expirations of the current agreements. The Postal Service refused to start then because the unions, departing from past procedures, requested separate bargaining. The bargaining approach involved one set of negotiations for the two largest unions, the American Postal Workers (representing 300,000 workers) and the National Association of Letter Carriers (195,000), and another set for the Rural Letter Carriers (63,000) and the Mail Handlers Division of the Laborers union (39,000). The Postal Service asked the National Labor Relations Board to order the unions to bargain jointly, but the board upheld the unions' bargaining approach.

The Postal Workers and the National Association of Letter Carriers settled about 16 hours after the July termination date of their contracts. There was no walkout, although the unions' members had agreed to strike if they had no contract upon expiration of the existing one. The Rural Letter Carriers union, whose members (like the Mail Handlers) did not authorize a strike, settled several hours earlier on essentially the same terms as the two largest unions.

The 3-year contracts provided for $300 increases in annual salaries in July of each year, a $150 "contract signing bonus," a $350 cash payment each year, and possible payments under a new productivity plan. There was no change in the cost-of-living formula.

The Mail Handlers contended that the other unions had accepted inadequate pay, health, and safety provisions and opted for resolution of these and other issues through continued bargaining. This failed and the parties were in arbitration at yearend.

Airlines—controllers fired. A strike by 15,000 members of the Professional Air Traffic Controllers Association (PATCO) began on August 3, after they rejected an offer valued at $40 million a year from the Federal Aviation Administration. The accord would have raised controllers' annual earnings by 6.6 percent, or about $2,300. (This would have been in addition to the 4.8-percent increase PATCO members, and other Federal white-collar employees, were scheduled to receive in October.) Part of the increase would have resulted from a new "responsibility differential" giving the controllers time-and-one-half pay for the 37th, 38th, 39th, and 40th hours worked in a week; the balance would have come from increasing premium pay to 15 percent, from 10 percent, for hours worked between 6 p.m. and 6 a.m., and from eliminating a requirement that premium pay for Sunday and holiday work count toward the $1,927.40 statutory limit on biweekly pay. The rejected accord also would have given employees a greater voice in developing operating rules and in selecting new equipment.

Reportedly, the workers turned down the proposed agreement and walked out because they wanted a larger pay increase, accelerated retirement to counter the problem of job stress, and a shorter workweek.

President Reagan warned that strikers who did not return to work by 3 p.m. on August 5 would be fired for violating the no-strike law applicable to Federal employees. Despite this ultimatum, only a few hundred strikers returned to work; the Administration then began the procedures necessary to terminate the workers, took steps to decertify PATCO as the workers' bargaining representative, and began the long process of training replacements for the dismissed workers. In October, the Federal Labor Relations Authority, (which oversees labor relations in the Government), decertified the union; PATCO's appeal is presently in Federal court.

The walkout did not draw heavy support from other unions; one apparent reason was that they may not have wanted to be involved in an illegal stoppage. But it did spawn a variety of opinions about the rights of public employees. Labor mediator Theodore W. Kheel said that the strike pointed out the "inherent, irresolvable conflict between giving public workers the right to bargain on one hand, and declaring strikes by such workers illegal on the other." (Federal employees are generally not permitted to bargain on wages and benefits, but the Federal Aviation Administration had agreed to bargain with PATCO because of concern over the stress and equipment problems faced by controllers. Any resulting settlement could have been implemented only by congressional action.)

As the year ended, the strikers' appeal was still before the courts, the Administration had submitted the rejected settlement to the Congress for enactment, and labor and consumer leaders were filing a suit alleging that the Administration's refusal to rehire the strikers was disrupting air travel and endangering public health and safety.

Railroads—39-month contracts. The procedure leading to settlements for nearly half a million railroad workers began early in the year, when the 13 unions served the required notices on the carriers specifying their demands for changes in wages, benefits, and work rules. However, intensive negotiations started in August, after the unions and the carriers agreed on proposed changes in the Railroad Retirement Act and sent them to the Congress for action.

In mid-November, six unions and the National Railway Labor Conference, the industry bargaining arm, settled on a 39-month contract for 240,000 workers. Reportedly, the accord provided for a total pay increase of 32.5 percent plus improvements in health and welfare benefits. The union gave up its demand for a liberalized cost-of-living pay adjustment clause because, according to Railroad and Airline Clerks president Richard Kilroy, "it wasn't the time to be saber rattling," referring to the recession and President Reagan's response to the strike by air traffic controllers. The members of the six unions will continue to receive semiannual adjustments calculated at 1 cent for each 0.3-point movement in the BLS Consumer Price Index for Urban Wage Earners and Clerical Workers (1967=100). As before, pairs of adjustments are limited to the amount resulting from an 8-percent rise in the index.

In an earlier settlement, the Consolidated Rail Corp.'s union-represented employees had agreed to limits on wage increases intended to save the deficit-ridden carrier $600 million. Employees not represented by unions gave up a proportionate sum of $57 million.

The Conrail settlement with the various unions provided that employees receive the same wage-and-benefit terms as each union's "national" settlement, except that all wage increases to be effective before January 1, 1982, would be paid only to the extent that their sum exceeded a 10-percent increase. Increases effective on or after January 1, 1982, would be paid to Conrail employees, but only to the extent that their sum exceeded a 12-percent pay increase.

The wage limit goal for Conrail employees was specified in the Northeast Rail Service Act of 1981, which also provided for additional Federal financial aid to Conrail (Conrail was formed in 1976 to take over the freight operations of six bankrupt railroads); for a possible employee purchase of Conrail in 1984 if two financial tests are passed in 1983 (if Conrail does not pass both tests, the Secretary of Transportation would be permitted to sell Conrail in parts); and for Conrail to reduce its 17,000 miles of track and its number of employees, with affected workers receiving severance payments financed by a designated part of the Federal aid. In a hopeful note, Conrail announced a third-quarter profit of $64.9 million, only the third profitable quarter in its history. In the third quarter of 1980, Conrail had lost $88.1 million.

As noted, the delay in reaching a national rail accord occurred because the parties were busy formulating proposed amendments to the Railroad Retirement Act. The Railway Labor Executives Association, composed of leaders of the 21 rail unions, reported that the fund was nearly exhausted because of the size of cost-of-living adjustments, and because there were more than a million current beneficiaries and only about 560,000 active employees.

The resulting legislation provided for a number of changes designed to help close the gap between fund income and benefit payments. One change reduced the social security payment to retirees eligible for both social security and railroad retirement benefits as a result of service performed under both systems prior to 1975. The reduction varies according to the amount of money allocated by the Congress for a particular fiscal year; for the fiscal year beginning October 1981, the reduction would be about $23 a month, or 21 percent.

The employer and employee financing rate for "Tier I" benefits (similar to social security benefits) remained at the same level as the rate for workers covered by social security, but the employer payment rate for "Tier II" benefits (similar to usual pensions in other industries) was raised to 11.75 percent of the first $1,850 of monthly earnings, from 9.5 percent. In addition, employees began contributing to Tier II benefits at a rate equal to 2 percent of the monthly earnings base.

Coal mining—63-day strike. The United Mine Workers and the Bituminous Coal Operators' Association (BCOA) had predicted a peaceful renewal of their contract, although their last five collective bargaining settlements were preceded by strikes. Some of the factors influencing the goal of a strike-free settlement were the desire to demonstrate that their mines could be relied on to help alleviate the energy shortage; production declines in BCOA mines and accelerated production in western surface mines where the UMW has had limited organizing success; and concern over the possible fragmentation of the 130-member BCOA that could result from a stoppage. To decrease the chance of a strike, talks were started 6 months before the March expiration of the existing contract. The first settlement, on March 23, was rejected by the rank-and-file and a resulting strike lasted 63 days, ending when the operators agreed to modify certain provisions of the rejected contract.

One disputed point was resolved when the operators agreed to continue paying royalties to the miners' benefit funds on coal purchased for resale. The miners had contended that elimination of the royalty payment would lead to widespread purchase of coal from nonunion mines. The cost of this concession was partly offset by providing that current and future widows of miners who retired prior to December 6, 1974, would receive a $95-a-month pension beginning in March 1982, instead of the $100 a month that would have been effective 2 months earlier under the rejected contract.

The Arbitration Review Board was terminated. The board was established by the previous contract to make precedent-setting decisions on grievances. However, the parties agreed that existing precedents would be used to settle future grievances. The union had viewed the board as pro-management; explaining that the union had prevailed in only 8 of the 72 decisions in the board's 3 years of existence.

The approved contract also prohibited operators from contracting out work or leasing coal lands or operations if it deprived UMW members of work they had normally performed in the past. (The 1978 contract had required contractors and lessees to employ only UMW members, but this provision had been invalidated by a 1980 court decision.) Wage and benefit improvements included $3.60 an hour in "set" wage increases, including $1.50 in quarterly increases designated as cost-of-living adjustments but not contingent on the movement of the Consumer Price Index; increases in pensions for current and future retirees; adoption of dental coverage for miners and their dependents and increases in life insurance and sickness and accident benefits for miners.

The parties agreed to establish a joint committee to decide if each company should be permitted to maintain its own pension plan providing a standardized schedule of benefits, instead of the existing common plan funded by all companies.

Despite the duration of the walkout there was no major impact on coal users, who had built up larger than normal stockpiles in anticipation of a stoppage.

Pay and benefit concessions

The wage concession accords at Chrysler and Conrail drew the most attention, but there also were concession accords in other industries, including airline transportation, rubber, trucking, and meatpacking. Clearly, instances of worker concessions in 1981 exceeded the number in 1980 which, in turn, exceeded the number in 1979. However, the number of workers affected in 1981 was relatively small, compared with the number of workers covered by 1981 settlements that provided for improvements in wages and other contract provisions.

Airlines. The Nation's airlines continued to be buffeted by operating losses attributed to high fuel costs and cost competition resulting from deregulation of the industry. In addition, the air traffic controllers strike was expected to restrict air traffic for at least 2 years. As a result of these events, some unions agreed to wage concessions to aid their employers.

The concessions varied. The accord between United Airlines and the Air Line Pilots Association provided for the pilots to receive a 29-percent pay increase over the 26-month contract term. In return, the pilots agreed to a number of changes in operating rules to improve productivity, such as a 7.5 hour increase in maximum credited monthly flying hours; a reduction in the number of nonflying hours credited as flying hours; use of two pilots on Boeing 737 aircraft; and a straight salary instead of the previous complex pay formula that was based on such things as the speed and weight of the aircraft and whether the flight was at night or over water.

Most of the other concession agreements generally provided for a 10-percent pay decrease extending for specified periods. At the end of that period, pay scales would be restored to the prereduction level and raised by the amount of any pay increases that had been scheduled to go into effect during the period.

Trucking. In September, the Teamsters union announced that it would accede to the industry's request for early bargaining on renewal of the current 3-year agreement, scheduled to expire in March 1982. Union president Roy Williams indicated that the union "could live with" a freeze on specified pay increases in the new contract if fringe benefits and cost-of-living allowances were maintained. At the time, 117,000 members of the union were on layoff in the trucking industry, compared with 60,000 a year earlier.

In 1980, the Teamsters turned down an industry request to reopen bargaining on the labor-cost issue. Since then, some local unions have agreed to pay cuts or changes in work rules to aid their employers. One example was Yellow Freight Systems of St. Louis, where changes in work rules included a ban on premium pay for nonovertime weekend work. This change was expected to save the company $265,000 over a 1-year period.

System 99, a California-based trucking firm tried a different approach. About 1,500 of its employees participated in a voluntary plan under which they received only 85 percent of their usual pay. The company will pay the withheld amount in monthly steps beginning in May 1982 if its income exceeds basic expenses.

Rubber. Rubber workers continued to experience difficulties in 1981, and agreed to wage or work rule concessions to help assure continuation of their jobs. Problems plaguing the industry included increased production of lighter cars and radial tires contributing to longer tire wear, a reduction in driving resulting from higher fuel costs, and obsolete plants.

The first concession accord involved a Firestone Tire and Rubber Co. plant in Memphis, Tenn., which produces bias ply tires. The changes included a "restructuring" of jobs that would result in lower pay rates for nonincentive employees (incumbents were guaranteed their current rates); a requirement that maintenance workers perform some work outside their normal trade, in exchange for increased pay when they became proficient in the new duties; and adoption of a 7-day-a-week operation, with straight-time pay for nonovertime weekend work.

A majority of the 13 Rubber Workers' locals that bargain with Goodyear Tire & Rubber Co. approved a concession accord at a plant in Topeka, Kans., after first rejecting it. One change called for straight-time pay for nonovertime weekend work. Goodyear said it would now be able to operate the plant more efficiently and proceed with plans to convert the plant from production of bias-ply tires to production of radial truck tires. The conversion may mean that Goodyear will not close down a 44-year-old plant in Jackson, Mich., which also produces bias-ply tires. Goodyear said it did not need two plants producing the same type of tires.

Meatpacking. The industry most severely hit by production cutbacks, plant closings, and employee pay concessions in recent years has been meatpacking. Cutbacks have been limited to the "old line" meatpackers, who experienced serious difficulties in competing with new companies which usually have lower paid nonunion labor and modern single-story plants located in animal producing areas, and which use techniques such as selling precut boxed meat.

Examples of concessions in the industry include a Swift & Co. plant in Rochelle, Ill., that was closed, then purchased by Dubuque Packing Co. and reopened with, according to employees, a 60-percent cut in compensation and Dubuque Packing Co., which reversed its decision to close a plant in LeMars, Iowa, after employees agreed to a 2-year freeze on wages and benefits.

Similar concessions and bargaining were also underway with other companies. Virtually all of the production workers at the "old-line" companies (Armour and Co., Swift & Co., Wilson & Co., Cudahy Co., for example) are covered by agreements with the United Food and Commercial Workers that expire in 1982.

Union wage increases, strikes

Major collective bargaining settlements (those covering 1,000 employees or more) reached in private industry during the first 9 months of 1981 provided wage adjustments averaging 11.5 percent for the first year of the contract and 9.3 percent a year over the life of the contract. The average adjustment when the same parties bargained previously (on average about 32 months earlier), was 9.2 percent in the first contract year and 7.8 percent over the life of the agreement. Settlement data exclude wage changes that occurred under cost-of-living adjustment (COLA) clauses.

During the first 9 months of 1981 settlements covered 1.5 million workers in 418 major collective bargaining units. Approximately 9 million workers in about 2,000 units are included in the Bureau of Labor Statistics' major collective bargaining series.

Because measures of wage settlements exclude possible COLA changes, they tend to be lower in settlements with COLA clauses. First-year negotiated adjustments averaged 7.9 percent in agreements with COLA clauses, compared with 12.4 percent in those without; wage adjustments over the life of the agreements were 6.4 percent and 10.0 percent, respectively. Agreements with COLA clauses had an average duration of 33.6 months; those without averaged 30.6 months.

COLA clauses covered 306,000 workers or 21 percent of those under settlements concluded during the first 9 months of 1981. About 45,000 workers were covered by seven agreements which introduced COLA clauses or reestablished a COLA provision that had been dropped earlier. COLA clauses were dropped in nine agreements, covering 28,000 workers. When benefits were combined with wages (in settlements for 5,000 workers or more) the average adjustment was 11.8 percent in the first contract year and 10.0 percent over the life of the agreement.

In a broader measure of wage change, about 7.7 million workers received "effective" adjustments averaging 8.4 percent during the first 9 months of 1981. This data series combines wage changes resulting from settlements during the period with deferred increases resulting from earlier settlements and increases under COLA clauses. When the 8.4-percent increase was prorated over the 9 million workers under major agreements (including the 1.3 million who did not receive an increase during the period), the average adjustment was 7.1 percent.

Fewer work stoppages. Labor-management disputes led to about 3,563 work stoppages that either began in the first 10 months of 1981 or began earlier and were carried over into the period, according to preliminary estimates. This was lower than for the comparable periods of all recent years. Similarly, there were fewer workers involved in strikes in the first 10 months than in the comparable period of any recent year. The data are limited to stoppages involving six workers or more and lasting a full shift or longer.

State of unions

Data for 1981 are not yet available, but union membership dropped to 20.9 percent of the labor force in 1980, from 24.7 percent 10 years earlier. Actually, the number of union members increased from 21.2 million to about 22.4 million over the period but this gain was more than offset by the growth of the labor force.

The economic difficulties in some industries were evident from decreases in membership of certain unions from 1978 to 1980. The Auto Workers led the declines (down by 142,000 members), followed by the Steelworkers (48,000), the Clothing and Textile Workers (46,000), and the Teamsters (33,000). Percentagewise, the most seriously affected were the Rubber Workers (down 15.2 percent), Oil, Chemical and Atomic Workers (14.4 percent), and the Auto Workers (9.5 percent). The State, County and Municipal Employees gained the most members over the 1978–80 period (78,000 or 7.6 percent), followed by the Food and Commercial Workers (64,000 or 5.2 percent), and the American Federation of Teachers (49,000 or 9.8 percent).

In 1981, there was no major organizing breakthrough, such as that which occurred in 1980 when the Clothing and Textile Workers succeeded, after a 17-year campaign, in organizing several of J.P. Stevens & Co.'s 75 textile mills. A cautious working relationship has developed between the parties in the wake of their 1980 agreement in which Stevens recognized the Clothing and Textile Workers as bargaining agent at 10 of its plants in return for the union's promise to end its consumer boycott and publicity campaign. The union lost the one representation election held in 1981 at a Steven's denim manufacturing plant in South Carolina, but contended that the loss was not significant because it was the first election at the plant.

The Steelworkers union continued its 7-year campaign to gain the right to represent workers at DuPont Co. Currently, the Steelworkers represent workers at one DuPont facility in Minnesota. In November, the parties ended a dispute by agreeing that representation elections would be conducted at 16 plants in December 1981. DuPont has about 100 plants, with about 70,000 production workers. About 40 percent of the workers are represented by unions, usually local independent unions.

Although several unions discussed merger possibilities during the year, there was only one merger (the American Radio Association with the Masters, Mates, and Pilots). This was not indicative of the pace of mergers in recent years—eight mergers during 1980 and 1981 accounted for 13 percent of all mergers that have occurred since the unification of the American Federation of Labor and the Congress of Industrial Organizations in 1955.

In internal union affairs, the major event was the reaffiliation of the Auto Workers with the AFL-CIO. Auto Workers' president Douglas Fraser said the return would "strengthen the trade union movement." The union left the federation in 1968 because of policy differences between Auto Workers' president Walter Reuther and AFL-CIO president George Meany.

There were several leadership changes—Teamsters' president Frank E. Fitzsimmons died and was succeeded by Roy Williams; Railway Clerks' president Fred J. Kroll died and was succeeded by Richard I. Kilroy; and Rubber Workers' president Peter Bommarito retired and was succeeded by Milan Stone.

Labor laws and regulations

Although the economic and social policies of the new Administration drew the most criticism from organized labor, unions were also concerned about changes planned or instituted in labor laws and regulations.

Davis-Bacon Act. The Administration announced plans to modify the Davis-Bacon Act, which authorizes the Department of Labor to set wage levels for workers on federally-financed construction project based on the prevailing area wages. Secretary of Labor Raymond Donovan emphasized that the proposed changes would significantly reduce the cost of construction projects. This position was supported by a study conducted by the Carter Administration's Council of Economic Advisers, and by a 1979 study by the General Accounting Office (the investigative arm of the Congress) which called for repeal of the act. Objecting to the proposal, Robert Georgine, president of the AFL-CIO's Building and Construction Trades Department, argued that the act prevents contractors from importing workers from other communities to drive down labor costs to win Federal contracts.

The proposed changes would set the pay rate for any given trade on a project at the rate prevailing for at least 50 percent of the workers in that trade in the area, or if a majority were not paid the same rate, at the average for all employees in that trade (now, pay rates can be based on the prevailing rates for as few as 30 percent of the workers in the area); permit contractors to use one helper for every five journeypersons; prohibit the use of urban wage data in setting rates on rural projects; and reduce reporting requirements for contractors. A decision on these proposals is expected in 1982.

Service Contract Act. In a companion move, the department proposed changes in the Service Contract Act, which requires contractors servicing Federal agencies to pay their employees the Federal minimum wage or the prevailing local wage for the occupation, whichever is higher.

The proposed changes called for exemption of a number of types of contracts, including those for research and development and for maintenance and repair of computers and scientific equipment. A final decision on this proposal also is expected in 1982.

Job safety and health. With the change of administration came a change in the approach to the Occupational

Safety and Health Administration's rule-setting and inspection methods. In accord with a presidental order directing Federal agencies to assess the costs and benefits of major regulations, OSHA began a review of its standard for employee exposure to cotton dust. The cost-benefit approach to rule setting drew sharp criticism from labor leaders, particularly from the Clothing and Textile Workers union. And in June, the Supreme Court ruled that OSHA must protect workers against toxic substances to the greatest extent possible, without regard to the balance between cost and benefit.

Other actions taken by OSHA during the year included a drive to eliminate unnecessary rules, a program to permit worker-management teams to conduct safety inspections in firms that have good safety records (all other firms would continue to be checked by OSHA or State inspectors); issuance of a noise standard, replacing the standard issued in the closing days of the Carter Administration, and withdrawal of the "walkaround pay" rule that required employers to compensate employees for time spent accompanying OSHA inspectors.

Home-work restrictions. A controversy that lasted throughout the second half of the year erupted when the Department of Labor announced proposals to lift the ban on employers hiring people to perform certain types of work in their homes. The proposal came after a group of knitters in Vermont protested the Department's move to stop them from producing ski wear in their homes. The general arguments of the Ladies Garment Workers, the Clothing and Textile Workers, and many manufacturers were that the change would result in a substantial increase in "sweatshop" operations that would offer unregulated, unfair competition to firms that use inplant labor.

The October decision lifted the ban on knitting outerwear at home but continued the ban for women's apparel, jewelry, gloves and mittens, buttons and buckles, handkerchiefs, and embroideries.

Later, the two unions and a number of knitted outerwear makers sued the department, contending the decision was contrary to most of the comments and testimony received on the issue and that the change would foster unfair competition.

Anti-discrimination. The new Administration also brought new approaches to enforcing Federal anti-job discrimination laws. The Department of Labor proposed some revisions of its anti-bias regulations covering companies that do business with the Federal Government. One change would exempt companies with fewer than 250 employees and a contract worth less than $1 million from preparing a written plan for hiring women and minorities. Currently, rules cover firms with 50 workers or more and a $50,000 contract. Other changes would exempt employers from setting goals and timetables for job groups in which women and minorities equal at least 80 percent of their availability in the general work force; permit contractors with 250 to 499 employees to file abbreviated affirmative action plans; eliminate pre-award reviews of employers scheduled to receive Federal contracts of at least $1 million; and reduce from 16 to 9 the number of affirmative action steps required of construction contractors and apply the steps, goals, and timetables only to the larger contractors.

Equal employment opportunity

The year was marked by a surge of interest in the "comparable worth" theory. In general, proponents of the theory contend that women should be paid the same as men—even if their duties are different—if the jobs are of comparable worth to society. Opponents contend that implementation of the theory could severely disrupt the economy because of the extreme difficulty of making precise comparisons of the worth of dissimilar jobs.

Attention focused on the Supreme Court ruling on the issue: the court held that a woman may not be paid less for a job simply because she is a woman, and that women who claim that their wage rates have been undervalued because of sex discrimination may file suit under Title VII of the Civil Rights Act of 1964. Previously, the only remedy was under the Equal Pay Act of 1963, which requires equal pay for equal work. Supporters of the theory described the Supreme Court decision as a major step toward comparable worth; their adversaries said the implications of the decision were much more restricted.

Some major disputes concerning equal employment opportunity were settled during the year. Sears Roebuck & Co. and the Equal Employment Opportunity Commission (EEOC) settled out of court on a series of racial discrimination charges, ending an 8-year dispute. The accord called for Sears facility managers to intensify their efforts to attract minority job applicants and to document their efforts for the company's group managers and the EEOC.

A Federal district judge revoked an order issued by the Department of Labor in July 1980 that banned Firestone Tire & Rubber Company from doing business with the Federal Government because of alleged employment discrimination. The judge held that the department had relied on an erroneous internal memorandum written by a Firestone employee. Firestone actually did not lose any government business during the period because it obtained stays of the debarment order pending a final judicial decision. □

State labor legislation enacted in 1981

The minimum wage was raised in 26 jurisdictions, sometimes above the Federal rate; more attention was paid to special protection for 'whistleblowers' and unemployment from plant closings and layoffs, as well as for veterans and disabled workers; and one State repealed its prevailing wage law

RICHARD R. NELSON

State labor legislation passed in 1981 covered a wide variety of subjects,[1] including such traditional fields as minimum wage, prevailing wage, child labor, job discrimination, and regulation of private employment agencies. At the same time, new interest was shown in problems of "whistleblower" protection and of plant closings and resulting mass layoffs.[2]

Minimum wage rates were increased in 26 jurisdictions last year, primarily resulting from previously adopted wage escalation schedules, although a few increases were approved this year. Eighteen jurisdictions have a minimum rate for some or all occupations equal to or exceeding the $3.35-per-hour Federal standard that took effect January 1, 1981, the last scheduled increase prescribed by the 1977 amendments to the Fair Labor Standards Act. Two more States will reach the $3.35-an-hour rate during 1982.

In other minimum wage action, coverage in North Carolina was extended to employers of three or more rather than four or more as before; the minimum salary level for exemption of executive, administrative, or professional employees was increased in Maine; and in Oregon, persons over age 65 were removed from a list of those for whom a subminimum hourly wage rate may be set.

Laws pertaining to wage garnishment or assignment were enacted in 16 jurisdictions, with many setting limits on the amount of earnings subject to assignment for the payment of child support. Employees in Alaska, Illinois, Louisiana, Nevada, Tennessee, and Wyoming are now protected from disciplinary action imposed as the result of any garnishment or assignment, and existing protections were expanded in Hawaii, and North Dakota. Rhode Island made the wages of State and local government employees subject to garnishment.

Again in 1981, as in the last two years, many bills were introduced to repeal State prevailing wage laws. Although bills were introduced in 14 States, only the Utah law was repealed, an action taken over the Governor's veto. All the other repeal attempts failed, including bills vetoed in Colorado and New Mexico; measures in California and Wisconsin, still in committee, will be carried over to the 1982 legislative session. Courts in Michigan and Missouri upheld the constitutionality of the prevailing wage laws in those States, both of which rely solely on collectively bargained rates as the prevailing rates. Decisions on the same issue had differed in previous years. The New Jersey law was upheld and the Arizona rate determination methodology was ruled invalid.

In other prevailing wage developments, Rhode Island made wage-rate violators subject to an 18-month ban on bidding for or being awarded a public contract. The labor department in Montana was given subpoena pow-

Richard R. Nelson is a labor standards adviser in the Division of State Employment Standards, Employment Standards Administration, U.S. Department of Labor.

er to compel the production of payroll records, and the prevailing wage rate is to be included in bid specifications and contracts. New Jersey extended coverage of its prevailing wage law to any construction by the New Jersey Building Authority. Oklahoma mandated use of Federal Davis-Bacon rates where available and required payment of prevailing fringes. In Washington, wage rates must now be posted at the job site.

A comprehensive law in Minnesota grants seasonal farmworkers important new protection. These workers now must be paid for a guaranteed number of hours; are to be provided written pay statements itemizing deductions from wages; and are to be informed, at the time of recruitment, of the minimum duration of employment, and of working conditions, wages, and housing provision if any.

Similarly, in Oregon, a new amendment requires that migrant workers be furnished with the names and addresses of their employers, with notification of any labor dispute at the work site, and with statements of hours of work and rates of pay. Texas prohibited the use of short-handled hoes in most agricultural labor.

Texas adopted a comprehensive new child labor law setting 14 as the basic minimum age for employment, requiring the Labor Commissioner to determine hazardous occupations for workers under age 18. The law also prescribes hours of work restrictions, and provides for age certificates and the issuance of individual variances. In other States, most of the changes in child labor law involved the easing of either nightwork restrictions (Alaska, Connecticut, Florida, Maine, and Oregon) or of certificate requirements. New Jersey, Virginia, and West Virginia passed laws permitting minors to participate in activities of volunteer fire departments or rescue squads.

In a year designated as the International Year of Disabled Persons, State interest in furthering equal opportunity for handicapped individuals was reflected in the enactment of laws in 13 States, to provide new or expanded employment rights or opportunities. Among the more significant were a new equal-employment-for-the-handicapped law in Georgia; an amendment to the Civil Rights Act in Oklahoma, adding discrimination because of handicap to the list of unfair employment practices; and an amendment to the Vermont antidiscrimination law, prohibiting discrimination in employment based on physical or mental condition. Tennessee and Texas provided for alternate forms of testing handicapped job applicants. Other States extended protection from discrimination to additional classifications of handicapped individuals including those with mental impairments and the aurally handicapped.

Other forms of employment discrimination were the subject of legislation in 18 States. Among the more significant, public employees were made subject to the Hawaii Fair Employment Practice law, and the prohibition against sex discrimination was defined to specifically include discrimination because of pregnancy and related medical conditions. Connecticut also defined sex discrimination to include matters relating to pregnancy or related medical conditions, and also required that employees be informed of substances involved in the job which might cause birth defects, or be hazardous to a worker's reproductive system or to the fetus. Employment, transfers, or promotions may not be conditioned on the sterilization of the employee. A new law in Alaska prohibits sex discrimination in employment in public education.

In an area of emerging interest, California established a policy of "comparable worth" in setting salaries in State government in jobs dominated by women, on the basis of the value of the work performed. Resolutions were passed in Hawaii urging all employers to adopt this concept of equal pay for work of comparable value.

The antidiscrimination law in Vermont was amended to prohibit age discrimination, and mandatory retirement because of age was prohibited except for police officers, firefighters, and tenured employees of colleges and universities. The upper age limit in the ban on age discrimination in employment was raised from 65 to 70 in Georgia and Oregon. Although Nevada, which formerly had no age limits, made the prohibition on age discrimination inapplicable to those not between age 40 and 69.

Legislation for the benefit of veterans was enacted in a number of States. These laws either provide preference in public employment for veterans or their spouses, or establish training programs or seminars to further employment opportunities.

There is extensive State interest in developing legislative remedies to alleviate the impact of plant closings on workers and communities. Measures of this nature were proposed in 19 legislatures this year but not adopted. Although the proposals are not identical, they share one or more features, such as advance notice, severance pay, entitlement to retirement benefits, creation of a community assistance fund and, sometimes, employee option to purchase the plant. The only laws enacted in the past are a 1975 Wisconsin statute requiring that the State labor department be notified in advance of any closings, and a Maine law, expanded this year, which requires advance notification to the labor department, the employees, and the municipality, and severance pay to employees. Connecticut created a committee to study plant relocation and mass layoffs and to make legislative recommendations to the 1982 General Assembly.

California prohibited awarding of State contracts to contractors found to be in violation of a National Labor Relations Board order more than once in the preceding two years. Similar laws were enacted in Michigan, Ohio, and Wisconsin in 1980 and in Connecticut in 1979. Among other labor relations laws, local public employees in California were authorized to negotiate agency shop agreements, collective bargaining rights were extended to county employees in Maine, and North Carolina prohibited strikes by public employees.

Twelve States enacted legislation affecting the regulation of private employment agencies. Most significant actions were in South Dakota, which repealed its law; Montana, where maximum placement fees charged by agencies will no longer be set by statute; and South Carolina, where licensing and enforcement authority were removed from the Department of Labor, and rulemaking, investigatory, and penalty provisions were deleted from the law. Licenses in South Carolina will now be issued by the Secretary of State, and enforcement will be by court action. Several amendments were made in the Ohio law, including a ban on registration fees, tightened restrictions on misleading advertising, and requirements that applicant contracts be in writing and placement fees refunded in certain circumstances. Maximum placement fees for jobs paying less than $13,000 annually are now set by statute.

Five States: Connecticut, Illinois, Louisiana, Ohio, and Oregon, amended individual statutes in 1981 to protect from employer retaliation an employee who reports a violation of law or participates in an enforcement proceeding. Michigan adopted a separate "Whistleblowers' Protection Act" to afford such protection to all employees in both the private and public sectors.

The following is a summary, by jurisdiction, of labor legislation during 1981.

Alabama

Wages. Up to 40 percent of a parent's weekly disposable earnings are now subject to court-ordered garnishment for child support.

Alaska

Wages. By prior law, which sets the minimum wage at 50 cents per hour above the Federal rate, the minimum wage rate rose to $3.85 on January 1, 1981.

Orders for support of a minor child now have priority over all other assignments or garnishments, and must contain an income assignment order, with 50 percent of gross wages or $100 a week, whichever is less, exempt from assignment. Employees may not be discharged on the basis of this assignment.

Child labor. Restrictions for minors under 16 were relaxed to permit work as early as 5 a.m. and until 9 p.m. Previously, minors could not work before 6 a.m. or after 7 p.m.

Equal employment opportunity. Sex discrimination is now prohibited in employment in public education. No difference is allowed between the sexes in conditions of employment or advancement opportunities, and affirmative action procedures are to be developed by the State Board of Education, which will administer this law. Career counseling services must stress access to opportunities without regard to sex.

Arizona

Private employment agencies. The law regulating private employment agencies no longer applies to agencies which do not charge a fee to job applicants.

Employment and training. Among numerous limitations placed on State agency competition with private enterprise, the Department of Economic Security, which administers the public employment service, is expressly prohibited from engaging in activity not prescribed by Federal or State law or Federal regulation, and may not participate in radio, television, or newspaper advertising of specific job openings unless prescribed by Federal law.

Other laws. Training programs receiving State assistance under the Work-Site Education and Training Act must now ensure training on a priority basis to Vietnam era veterans in addition to other groups previously specified.

Arkansas

Wages. The minimum wage rate was increased from $2.70 an hour to $2.80 effective January 1, 1982 with a further increase to $2.95 scheduled for January 1, 1983. In addition, the maximum tip credit allowance permitted was changed from a dollar amount to 50 percent of the minimum wage.

California

Wages. Prior wage orders provided for an increase in the minimum hourly wage rate from $3.10 to $3.35 effective January 1, 1981.

Compensation of prison inmates for productive work in prisons was changed from a previous rate range of 2 cents to 35 cents an hour, to a rate not to exceed half the minimum wage.

The prevailing wage law threshold amount was increased from $500 to $1,000.

Ski establishment employers may arrange a regularly scheduled workweek of up to 56 hours without being in violation of overtime pay regulations, provided employees receive premium rates after 56 hours.

Equal employment opportunity. A new measure, effective in January 1982, established a policy of "comparable worth" in setting salaries based on value of work for women-dominated jobs in the State service. Also, the Department of Personnel Administration is to examine comparable worth studies done by other jurisdictions and make an annual report on them to the legislature, and to the exclusive bargaining agent of State employees prior to collective bargaining.

Compulsory retirement, otherwise prohibited for employees who wish to and can continue working, will be permitted for physicians who have attained age 70 and are employed by a professional medical corporation with bylaws on compulsory retirement.

The Fair Employment and Housing Commission was transferred from the Department of Fair Employment and Housing to the State and Consumer Services Agency. Under the same law, apprenticeship programs are no longer exempted from the prohibited age limitations in the age discrimination law.

Prohibitions on sex discrimination in employment may not affect the right of an employer to provide preferences for veterans and their surviving spouses. The law also prohibits the use of State funds to challenge this provision in court (an existing regulation provides that veterans preference may not be used as a basis for selection unless work performed during military service is related to job performance, except where required by a constitutional provision authorizing such preference in the civil service, or by Federal law). A similar new law also allows employers to give special consideration to Vietnam era veterans.

Worker privacy. The law prohibiting employers from compelling employees or applicants to take a lie detector or similar test, now requires the employer, before requesting that the test be taken, to advise the employee in writing of the prohibition against compulsion.

The Department of Justice was authorized to furnish records of convictions to nonprofit corporations or other organizations, as specified by the Attorney General, involving sex crimes of persons who apply for employment, or volunteers for positions involving supervisory or disciplinary power over minors.

Labor relations. Local public agencies and their unions may now negotiate agency shop agreements. Religious or conscientious objectors may alternatively be required to pay sums, equaling union fees, to a nonreligious, nonlabor, charitable fund.

A new law was enacted governing local public transportation labor disputes, except for those involving local public agencies subject to other collective bargaining legislation. It provides for the exchange of contract proposals and data between the parties and for mediation of disputes. Where a strike or lockout appears likely, the Governor may appoint a board to investigate the issues and make a written report. Any strike or lockout during the period of investigation is prohibited.

Garment industry. A late 1980 law requires all garment industry manufacturers, jobbers, and contractors to register annually with the State Labor Commissioner, beginning July 1, 1981, and to keep certain hour, wage, production, and contract price records. Failure to register or doing business with an unregistered contractor may result in penalties, including fines and garment confiscation.

Private employment agencies. Agents for professional athletes are now to be licensed and regulated by the Labor Commissioner. Agents must deposit a $10,000 bond and may not engage in certain practices.

Employment agencies which use a computer system as their only means of procuring employment for clients, are no longer limited to a nonrefundable fee of $20. However, the fee to be charged for furnishing such services must be clearly stated in the contract.

Employment and training. The Director of Corrections is authorized to conduct demonstration industrial enterprises for prerelease work training of inmates. Inmates may be paid wages prevailing in comparable industries in the State, and wage deductions may be made for room and board, the California Victim Indemnity Fund, family support, savings, and personal expenses.

A California Welfare Employment Skills Training Act, administered by the Employment Development Department, provides for a program to give Aid-to-Families-with-Dependent-Children recipients vocational training and job placement assistance, so they may acquire marketable job skills.

Under the provisions of a new law, unemployed parents who do not qualify for Aid-to-Families-with-Dependent-Children under Federal standards, but who qualify for the State program, are to receive priority for employment and training services under certain existing programs, and special pilot projects to provide on-the-job training are to be developed for these individuals. This act will become operative only if funds are made available by the legislature.

Other laws. State contracts are to contain a sworn statement by the contractor that no more than one final finding of contempt of court has been issued against the contractor within the last 2 years because of failure to comply with a Federal court order, enforcing a ruling of the National Labor Relations Board. In case of a false statement, the State may rescind the contract.

Public entities may not permit any peace officer to be employed by a private sector employer as a security guard at the site of a strike, lockout, picketing, or other labor dispute which occurs in the same jurisdiction where the peace officer is regularly employed or on loan.

Colorado

Wages. Payment bonds must now be furnished on public works contracts exceeding $50,000, rather than on those exceeding $10,000 as was previously required.

Equal employment opportunity. The Division of Correctional Industries was authorized to contract for the training or employment of offenders, with training to be in accordance with standards set by the Department of Labor and Employment whenever possible. Wages earned under the program are to be used to compensate the offender's victims, pay support to the offender's dependents, defray costs of confinement, and establish a trust fund for the offender payable upon release.

Occupational safety and health. Coal mine inspections need now be made only once rather than four times annually, and inspections will be made only of mines in which an average of less than 75 full-time workers were employed during the preceding calendar year. Mines of larger size are deemed to affect interstate commerce and therefore are subject to Federal inspection.

Connecticut

Wages. By prior law, the hourly minimum wage increased from $3.12 to $3.37 on January 1, 1981.

Child labor. Minors age 16 and 17 may now work until 11 p.m. (rather than 10 p.m.) on days preceding schooldays, in restaurants or as ushers in nonprofit theaters.

Equal employment opportunity. Prohibited discrimination on the basis of sex was defined to specifically include matters relating to pregnancy, child bearing capacity, sterilization, fertility, or related medical conditions. Employers must inform employees and job applicants of substances involved in the job which may cause birth defects or be hazardous to a worker's reproductive system or to a fetus. Employment, transfers, or promotions may not be conditioned on the sterilization of the employee.

Labor relations. The State Labor Relations Act was amended to provide that an agent investigating complaints or violations referred by the State Board of Labor Relations shall not disclose any confidential communication made during the investigation, unless authorized by the party making such communication. Similarly, mediators appointed by the labor commissioner are now subject to the same restrictions.

No private employer or employee organization, involved in a labor dispute, may hire any member of a municipal police department in the town in which the dispute is taking place, for protection or other duties related to the dispute.

Private employment agencies. The surety bond that each employment agency must post was increased from $5,000 to $7,500, and agency license fees increased from $75 to $150.

Occupational safety and health. Any employee who believes there is a violation of the information and notice requirements for employers using or producing carcinogens may now request an inspection by filing a written complaint with the Labor Commissioner who is authorized to investigate and to assess civil penalties for violations. Retaliation against an employee for filing a complaint is prohibited.

Employment and training. The Department of Labor was authorized to contract with local and regional boards of education to provide full-time programs for adult basic education for qualified Work Incentive Program registrants.

Other laws. A committee consisting of legislative, labor, management and municipal representatives was created to study all aspects of plant relocation and mass layoffs, and to make recommendations for legislation to reduce the hardships.

Delaware

Child labor. An 18- or 19-year-old child of a liquor store retailer may be employed in the store, except in the sale or service of liquors (20 is the minimum age otherwise applicable).

District of Columbia

Wages. Wage Order Number 12, applicable to occupations not covered by other wage orders, was revised effective October 31, 1981 to increase the minimum wage rate for parking attendants to $3.40 an hour, provided that at least 40 cents an hour is received in tips; for car wash attendants to $3.50 provided that at least 15 cents an hour is received in tips; for day labor ticket takers and ushers to $3.75; and for all other occupations from $2.75 an hour to $3.90.

Wage Order Number 10, applicable to hotel, restaurant, apartment building and allied occupations was also revised to increase the minimum hourly rate from $2.80 to $3.80, effective January 2, 1982. Among other changes, the maximum tip allowance against the minimum wage was increased from $1.45 an hour to $1.95, and the minimum hourly rate for employees under the age of 18 was raised from $2.25 to $3.35.

Florida

Agriculture. The law providing for the licensing and regulation of migrant labor camps, which was scheduled for repeal on July 1, 1982 under sunset legislation, was extended to October 1, 1983.

Child labor. Numerous changes were made in the child labor law. Employment certificate provisions for children age 12 through 15 were repealed. Age certificates are authorized for such children, as well as for 16- and 17-year-olds, although employers may accept other forms of proof of age. Children are no longer permitted to work during school hours in domestic work or farm labor for their own parents. Nightwork restrictions for 16- and 17-year-olds were relaxed to allow work until 1 a.m. on days preceding schooldays, although individual variances had been allowed before.

Waivers of the child labor restrictions may be granted by the Division of Labor, on a case-by-case basis, if in the best interests of the child. High school graduates, minors who have served in the Armed Forces, and legally emancipated minors are exempted from coverage. Also, married minors and those with court approved employment continue to be exempt.

Equal employment opportunity. The prohibition under the Human Rights Act, against mandatory retirement, will not apply where individual applicants fail to meet bona fide job requirements. Nor will it apply where employment would require changes in bona fide retirement or pension programs or existing collective bargaining agreements during the life of the contract or until October 1, 1983, whichever is first. Employers may require physical examinations of applicants and employees to determine job fitness.

Labor relations. The definition of public employees, for collective bargaining purposes, was amended to exempt persons in inspection positions in Federal-State fruit and vegetable inspection service, persons employed by the Public Employees Relations Commission, and graduate and undergraduate students enrolled and employed by the State University System.

Occupational safety and health. Among changes to the law regulating elevators, annual safety inspection is now required, except that those elevators covered by a safety maintenance contract must be inspected every 2 years.

Employment and training. A new Public Assistance Productivity Act provides for the Department of Health and Rehabilitative Services to plan, integrate, and coordinate employment related services for public assistance recipients, and directs it to help fund a privately administered demonstration pilot project designed to reduce welfare costs and provide viable work opportunities to AFDC recipients.

The Department of Corrections is to lease the facilities of the prison industry program to a private nonprofit corporation organized solely for the purpose of operating the program. Deductions are to be made from prisoner wages for lodging, food, and other maintenance expenses, and for payments to dependents and crime victims.

Georgia

Wages. Employee pensions subject to the Federal Employee Retirement Income Security Act of 1974 (ERISA) are subject to garnishment only for alimony or child support, and then only when the benefits are currently due and payable or transferable to the pension plan's member or beneficiary.

Child labor. The minimum age for employment was lowered from 14 to 12. Formerly children 12 and 13 were permitted to work only in stores (with permits) and in occupations exempt at any age—agriculture, domestic service, and family employment. Prohibitions on specific occupations for minors under 16 were removed, and the Commissioner of Labor was given rulemaking authority to declare occupations hazardous. Changes were also made in the certificate provisions.

Equal employment opportunity. The upper age limit in the ban on age discrimination in employment was raised from 65 to 70.

A new equal-employment-for-the-handicapped law prohibits discrimination based on physical or mental impairment (other than drug or alcohol addiction) which substantially limits normal function. The law applies to both public or private employers of 15 or more persons, labor organizations, employment agencies, and to apprenticeship and other training programs, and will be enforceable in the courts.

A 15-member Commission on Women's Opportunities was created to study statutes, regulations and agency practices, to determine whether any distinction, exclusion, or preference is made based on sex, affecting equal employment opportunities. A report and recommendations are to be made to the Governor and the Legislature prior to the 1983 legislative session. The Commission may not make a recommendation on the merits of the Equal Rights Amendment to the United States Constitution.

Veterans' services are to be provided for surviving spouses of veterans, rather than only to widows as before, and veterans' preference in employment in the State Department of Veterans Service was also extended to widowers of veterans.

Guam

Wages. The minimum wage rose to $3.35 an hour on January 1, 1981, under a prior law which adopted the Federal Fair Labor Standards Act rates by reference.

A Child Support Employment Office was established in the Department of Public Health and Social Services, and the courts were authorized to order garnishment of wages or pensions for child support.

Hawaii

Wages. By prior law, the minimum wage rate was increased from $3.10 to $3.35 an hour effective July 1, 1981.

Employment under the work release plan of a youth correctional facility may now be at a wage less than the minimum wage, provided that no more than five hours of a person's work week will be paid at the subminimum rate.

Equal employment opportunity. Employees of State and local government are now subject to the Fair Employment Practice law, and prohibition against sex discrimination was defined to specifically include discrimination because of pregnancy, childbirth, or related medical conditions. Investigation and enforcement authority and procedures are now spelled-out in greater detail.

House and Senate resolutions were passed expressing concern over inequities in the salaries of women, and urging all employers to adopt the concept of equal pay for work of comparable value.

Other laws. The protection against suspension or discharge from employment because of wage garnishment, employee bankruptcy, or work injury, was extended to include an employee's testimony or being subpoenaed to testify in proceedings relating to any such suspension or discharge.

Another law specifically prohibited discrimination against an employee, in addition to discharge or suspension, because of garnishment, employee bankruptcy, or work injury.

Illinois

Wages. The requirement in the wage payment act that an employer notify the State Department of Labor of the amount of wages to be withheld when the amount or legitimacy of the deduction is in dispute, was amended to require the employer to also state in writing the reasons for withholding payment.

Courts may require an assignment of wages to enforce an order for child or spouse support. Employers may not discharge or discipline an employee as a result of such an assignment.

Agriculture. Migrant labor camps housing fewer than 10 migrant workers or four families must now meet certain specified safety and health standards and be open to inspection by the Department of Public Health, although a license is not required.

Worker privacy. Local governments and school districts may obtain information on convictions from the Department of Law Enforcement for use in evaluating the character and qualifications of employees and job applicants.

Other laws. The identity of any State employee who reports the violation of any law, rule, regulation, or mismanagement, may not be revealed during an investigation, and no disciplinary action may be taken against the employee.

Indiana

Employment and training. The Department of Commerce is to establish an industrial training program to train and upgrade the skills of potential employees of new or expanding industries.

Iowa

Labor relations. The law requiring that official meetings be open to the public was amended. It now exempts meetings of governmental bodies held to discuss strategy, involving negotiations with employees not covered by collective bargaining agreements.

Louisiana

Wages. An individual may not be denied employment or discharged because of a voluntary or involuntary assignment of wages.

Child labor. School records will no longer be required as a prerequisite for the issuance of street-trades permits or certificates for the employment of minors under 16 outside school hours during the school term.

Private employment agencies. Among changes to the employment agency regulatory law, the Private Employment Service Advisory Council was reconstituted to include three representatives from the industry, and one representative each from labor and consumer interests.

Occupational safety and health. Reprisals were prohibited against employees who report or complain of possible environmental violations. For infraction of the ban, in addition to other available remedies, an employee may bring civil action against the employer to recover triple damages and court costs including attorney's fees.

Employment and training. The Occupational Information Coordinating Council and the Governor's State Employment and Training Council were transferred to the Department of Labor.

Other laws. A new law gives preference in the awarding of nonconstruction public contracts to in-State vendors, over vendors from those States which favor their resident vendors over those from Louisiana. Public works construction contractors have been protected by a similar law.

Maine

Wages. The minimum wage rate was increased to $3.35 an hour on January 1, 1981, under a prior law which provided for matching State increases to the Federal rate, up to a maximum $4 rate.

The minimum qualifying salary for exemption from the minimum wage law as an executive, administrative, or professional employee was increased from $150 to $175 a week.

The law permitting wage deductions to repay an employee's debt to the employer was restricted to a debt of benefit to the employee, and banned deductions for such items as cash or inventory shortages, dishonored checks or credit cards, damage to the employer's property, or merchandise purchased by a customer.

Hours. A law was enacted permitting State government employees to work alternative work schedules including flexible hours, part-time work, and job sharing.

Child labor. Nightwork restrictions were amended to permit 15-year-olds to work until 10 p.m., rather than 9 p.m. as before. The starting time of 7 a.m. was unchanged.

Equal employment opportunity. In an effort to expand work opportunities for handicapped citizens, the State Purchasing Law now permits giving preference to goods or services produced by in-State sheltered workshops.

Labor relations. Collective bargaining rights, previously granted to employees of municipalities, schools, and special districts, were extended to county employees.

An employer may not cancel a group health insurance policy during a strike until the insured employees have been notified.

Occupational safety and health. Penalties were established for refusing to comply with the requirement that information be provided to employees about the identities and hazards of chemicals in the work area by such means as labels, chemical identification lists, and education and training.

Other laws. The name of the Department of Manpower Affairs was changed to the Department of Labor, and the name of the Bureau of Labor was changed to Bureau of Labor Standards.

In addition to making severance payments to employees and notifying the Director of the Bureau of Labor 60 days in advance of relocating or terminating an establishment, employers of 100 or more persons must now also notify employees and municipal officers at least 60 days before relocating an establishment outside the State.

Maryland

Wages. The minimum wage rate rose to $3.35 to match the Federal rate under the existing State law which conforms to the Fair Labor Standards Act rate by reference.

Those agricultural employees who are subject to the State minimum wage are to be paid time-and-a-half their usual hourly wage rate for work after 60 hours per week.

Equal employment opportunity. Employment discrimination against public school teachers because of handicap was prohibited, unless the handicap adversely affects the person's ability to perform the duties of the position.

Private employment agencies. Private employment agencies whose fees are completely employer-paid and that do not require job applicants to sign a contract are not subject to the agency licensing and regulatory law.

Occupational safety and health. Temporary help firms may not permit their employees to work in confined spaces such as tanks, tunnels, vats, and sewers, without written authorization of the Commissioner of Labor and Industry based upon a satisfactory showing of adequate worker protection, or without an approved variance.

Employment and training. A State Use Industries Organization was established to develop industries to provide full-time work experience or rehabilitation programs for eligible prison inmates.

Massachusetts

Wages. The minimum wage rose to $3.35 an hour on January 1, 1981, under provisions of a 1977 amendment.

Child labor. An exception was made to the hazardous occupations restrictions on minors under 18, permitting 16-and 17-year-old minors to be employed, consistent with Federal law, if enrolled in State or local cooperative vocational training programs under specified circumstances. Formerly the exception applied only to agricultural training programs.

Equal employment opportunity. Conscientious objection to abortion may not be grounds for dismissal, discrimination in hiring, failure to promote, or withholding of pay.

A special commission was established to study the concerns of Vietnam era veterans, including government programs and practices relating to employment, re-employment, retraining, and rehabilitation.

Labor relations. Among various changes involving the Board of Conciliation and Arbitration, the Board is now an independent agency, composed of a permanent chairperson who is authorized to appoint one labor and one management representative to the Board on a case-by-case basis.

Michigan

Wages. By prior law, the minimum wage increased from $3.10 an hour to $3.35 on January 1, 1981.

Constitutionality of the prevailing wage law, which relies solely on collectively-bargained rates to determine prevailing rates, was upheld by the State Court of Appeals. The appellate court reversed a lower court decision which had held the statute to be an unconstitutional delegation of legislative authority because of its method of rate determination.

Child labor. A minor may not work after sunset or 8 p.m., whichever is earlier, in an occupation that involves a cash transaction, unless an adult is present.

Equal employment opportunity. Among changes to the civil rights act for handicapped persons, coverage was extended to the restored mentally ill; employers were specifically required to accommodate handicapped persons unless it would impose an undue hardship. A union may not, because of a member's handicap give inadequate representation in a grievance process. Public contracts for the State or political subdivisions must include a prohibition against discrimination because of a handicap that is unrelated to the individual's ability to perform a particular job, and the Civil Rights Commission was given rulemaking authority.

Other laws. A "whistleblowers' protection act" was passed, prohibiting reprisal against public or private sector employees who report, or are about to report, any violation of a State, local, or Federal law, or who participate in an investigation, hearing, inquiry or court action. An employer may not discharge, threaten, or otherwise discriminate against such an employee. The employee may bring a civil action for injunction or damages or both, and the court may order reinstatement, back pay, and other relief.

Coverage of the law on standards of conduct for State employees was amended to include elected or appointed officials. New protections from adverse actions for public officers or employees who report or are about to report violations were added, and provision was made for bringing civil action against violators.

Minnesota

Wages. By prior law, the minimum wage rose from $2.90 an hour to $3.10 effective January 1, 1981. A further increase to $3.35 is scheduled for January 1, 1982.

Employee payments for required uniforms, special clothing, equipment, and certain travel expenses are to be subtracted from wages paid in calculating whether minimum wage requirements are met.

Overtime pay requirements will not apply to employers of sugarbeet hand laborers who are paid on a piece-rate basis, provided that the regular hourly rate of pay exceeds the minimum wage rate by at least 40 cents. This provision was to expire December 13, 1981.

Agriculture. A new law requires employers using agents to recruit out-of-State migrant workers to provide each worker, at the time recruited, with a written employment statement of the minimum duration of employment, working conditions, wages, and housing provision if any. Workers are to receive a minimum of 70 hours pay, at no less than the Federal minimum wage, in any two consecutive weeks, unless work is unavailable due to weather conditions. Workers are also to receive a written pay statement itemizing deductions from wages. Workers may bring a civil action in case of violation.

Equal employment opportunity. Individuals may now file equal employment opportunity complaints directly in the district court instead of seeking prior administrative resolution, and the Commissioner of Human Rights was authorized to adopt policies to determine the order in which charges are to be processed. Reprisals against persons who have taken part in actions under this law were defined to include any form of intimidation, retaliation, or harassment.

The enforcement provisions of the Human Rights Act were amended. Penalty payments may now include damages for mental anguish and suffering, and the maximum award of punitive damages was raised.

Worker privacy. The law regulating the collection and dissemination of data by State agencies was amended to, among other things, classify labor relations information on specific labor organizations, as nonpublic data, and to permit the dissemination of personnel data to unions when it is determined that the information is needed for elections and other purposes.

Labor relations. The definition of public employee under the Public Employment Labor Relations Act was amended to exclude part-time instructors in adult vocational education programs.

An exception was made to the State open meeting law permitting public employers to hold closed meetings to determine strategy for labor negotiations. Such sessions must be tape recorded and must be available to the public after negotiations are completed and a contract signed.

Mississippi

Hours. Restrictions on hours of work for persons over age 16 were removed. Hours had been limited to 10 per day in canneries, workshops, mills, factories, or manufacturing establishments. Night workers had been limited to 60 hours per week.

The law which prohibited a female from working more than 10 hours a day or 60 hours a week was repealed.

Missouri

Wages. In January 1981, the State Supreme Court upheld the rate determination methodology, used by the Labor and Industrial Relations Commission under the prevailing wage act.

Hours. The maximum 8-hour day in any mining, mechanical, chemical manufacturing, or smelting business was amended to allow additional hours with the employee's consent.

Montana

Wages. The minimum wage was increased from $2.00 an hour to $2.50 effective July 1, 1981 with a further increase to $2.75 scheduled for July 1, 1982. The minimum amount that may be paid to seasonal farm workers on a monthly basis in lieu of the minimum hourly rate was increased from $460 to $575 a month on July 1, 1981, and to $635 a month beginning July 1, 1982.

The labor department was granted subpoena power to compel the production of payroll records in case of public contractor refusal. Also, bid specifications and contracts are now to include the prevailing wage rates that are to be paid. Failure to do so relieves the contractor of his obligation to pay the prevailing wage rate and places such obligation on the contracting agency.

Private employment agencies. The maximum placement fees charged by private employment agencies will no longer be regulated by statute, but will now be determined by the agencies themselves. These fees were specifically made not subject to disapproval by the Commissioner of the Department of Labor and Industry. Agents for professional athletes were specifically exempted from the employment agency regulatory law.

Nevada

Wages. The prevailing wage law was amended to exclude construction projects costing less than $4,000 as well as contracts directly related to the normal operation of the government agency or the normal maintenance of its property, and contracts awarded to meet emergency situations resulting from natural or man-made disasters.

Payment bonds must now be furnished on all public works contracts exceeding $5,000, rather than on those exceeding $2,000 as was previously required.

Employers may not discharge or take disciplinary action against an employee because of court ordered wage assignment for child support.

Equal employment opportunity. Discriminatory actions based on an employee's age will not be considered unlawful if the person is less than 40 or more than 69 years of age. Formerly there were no age limits in the law.

The ban against unlawful job discrimination was extended to cover the hearing impaired (in addition to visual or physical handicap and other bases). It is unlawful for an employer to refuse to permit a hearing impaired employee to keep a hearing dog with him or her.

The labor commissioner is authorized to approve and regulate 6-month to 2-year programs for training in actual employment for veterans in occupations which do not offer programs of apprenticeship. Such programs must comply with Federal and State equal employment opportunity laws.

Worker privacy. A separate polygraph examiners licensing and regulatory law was enacted. Formerly, polygraph examiners were regulated along with private investigators, patrolmen, process servers and repossessors. The new law gives the examinee the right to refuse to answer any question which would tend to incriminate or degrade him. The person to be examined must be told of the purpose of the examination and consent to it in writing. The examination must not be conducted for the purpose of interfering with or preventing lawful activities of organized labor. Inquiries into the examinee's religion, political or labor organization affiliations, or sexual activities are prohibited unless germane and made at the request of the examinee.

Public agencies may request information from the FBI on the personal history of any person who is an applicant for a license or employment.

Occupational safety and health. Among amendments to the occupational safety and health law, a notice may be issued (in lieu of a citation) in cases of violations which are not serious and which the employer agrees to correct within a reasonable time. Also, temporary variances from standards adopted under the law will no longer be granted. Employers may still apply for permanent variances.

A comprehensive statute was enacted to control the generation, transportation, treatment, storage, and disposal of hazardous waste, and a separate statute instituted controls over the transport and disposal of radioactive, chemical, and other hazardous materials.

New Hampshire

Wages. By prior enactment, the minimum wage rate rose to $3.35 an hour on January 1, 1981 to match the Federal rate.

Equal employment opportunity. The Commission on the Status of Women which was to be terminated on July 1, 1981, under sunset legislation, was extended to July 1, 1987.

Occupational safety and health. The law regulating the management of hazardous wastes was amended to, among other things, require permits to transport such materials, and to prohibit employers from retaliating against employees for reporting violations as required by law.

The State Civil Defense Agency was directed to initiate and carry out a radiological emergency response plan for each nuclear electrical generating plant, in order to deal with the effect of nuclear incidents or accidents.

New Jersey

Wages. The minimum wage rate was increased from $3.10 an hour to $3.35 effective January 1, 1981. The rates for minors, whose minimum wage coverage is derived from wage orders rather than statute, were also increased to $3.35, without any youth differential based on age alone.

A New Jersey Building Authority was established to construct and operate office buildings and related facilities to meet the needs of State agencies. The Authority is to pay prevailing wage rates, as determined by the labor commissioner, to workers employed on its construction projects, and is to establish an affirmative action program for the hiring of minority workers.

Child labor. Activities of 16-to 18-year-olds in any Junior Firemen's Auxiliary were specifically exempted from hazardous occupation restrictions in the child labor law. (Junior firemen cannot be required to perform duties exposing them to the same degree of hazard as regular members of a volunteer fire company). Restrictions on employment of minors under 16 in theatrical productions were eased.

Equal employment opportunity. The law against discrimination in employment was amended to include discrimination on the basis of a person's atypical hereditary cellular or blood trait, including sickle cell, cystic fibrosis, or Tay-Sachs.

Private employment agencies. Temporary help service firms are no longer subject to the private employment agency regulatory law, provided that no fee is charged any employee. Such firms may not prevent employees from accepting other employment, or knowingly send employees to places where strikes or lockouts are in progress.

New Mexico

Wages. By prior law, the minimum wage rate was increased from $2.90 an hour to $3.35 effective July 1, 1981. The farm rate rose to $3.10 on July 1, 1981, with a further increase to $3.35 scheduled for July 1, 1982.

School attendance. A minor may be excused from compulsory school attendance at age 16, with parental consent, if he or she will be employed or engaged in an alternative form of education. Formerly the child could leave school on completion of the 10th grade, at whatever age, after a consultation between child, school officials, and parent, with no employment or other education requirement.

Other laws. The Human Rights Commission, the Labor and Industrial Commission, and the Office of Labor Commissioner, scheduled for termination under sunset legislation, were extended to July 1, 1987.

New York

Wages. By prior law, the minimum wage rate for nonagricultural workers was increased from $3.10 an hour to $3.35 on January 1, 1981.

The wage payment law was amended to require employers to notify employees of the company policy on sick leave, vacation, personal leave, holidays, and hours, through written or posted notice.

Employers must have the advance written consent of an employee before depositing his or her pay directly in a bank or other financial institution.

The labor commissioner, rather than the fiscal officer, will now determine the rate of interest to be imposed by orders directing the payment of wages or supplements, found to be due under the minimum wage act or the wage payment law.

Labor relations. Provisions in the civil service law for mediation and arbitration of collective bargaining disputes by the Public Employment Relations Board, due to expire July 1, 1981 were extended for 2 years.

Garment industry. A Garment Industry Job Retention Act was enacted, directing the Industrial Commissioner to study the garment manufacturing industry and the industrial homework process, including the feasibility of registration or licensing and bonding of employers in the garment industry. The study will also deal with labor standards practices and violations, and the adequacy of health and safety conditions. An advisory committee on garment manufacturing will be appointed to assist in the study, consisting of representatives of a cross section of the industry. Enforcement authority and penalty provisions were strengthened in the industrial homework law.

Occupational safety and health. The transportation law and the vehicle and traffic law were amended regarding the regulation of the transportation of hazardous materials. Rules and regulations are to cover transportation by highway, railroad or water, and are to be no less protective than those established by the Federal government. Hazardous materials were defined, training and education programs are to be established, and penalties were established for violation.

Employment and training. A pilot project to improve and expand employment opportunities for senior citizens through job development and placement efforts was established, to be implemented and administered by the Industrial Commissioner of the Department of Labor, in consultation with the Director of the State Office for the Aging.

Other laws. Contractors engaged in performing work or services, or providing goods to the State in an amount exceeding $5,000 are prohibited from participating in an international boycott in violation of Federal law. Contracts will not be let to contractors who have previously participated in such boycotts.

North Carolina

Wages. The minimum wage rate was increased from $2.90 an hour to $3.10 effective January 1, 1982 with a further increase to $3.35 scheduled for January 1, 1983. The law will now be applicable to employers of three or more rather than four or more as before.

Among other amendments to the wage and hour act, the subminimum wage rate for full-time students, learners, apprentices, and messengers will now be 90 percent of the basic minimum rate rather than a fixed dollar amount. Also, changes were made in some of the wage deduction provisions, and in the exemptions from minimum wage, overtime, youth employment, and record-keeping requirements.

Hours. A work-options program for State employees providing for flexible work hours, job sharing, and permanent part-time positions was established, to be administered by the State Personnel Commission.

Child labor. Among various changes in the youth employment law, youths 14-and 15-years of age may now be employed only in occupations permitted under the Fair Labor Standards Act (FLSA). Minors under 18 are still prohibited from working in occupations declared hazardous under FLSA. However, now the Commissioner of Labor may, after public hearing, declare additional occupations to be prohibited. Youths under 18 may not prepare or serve alcoholic beverages and youths under 16 may not be employed on the premises where such beverages are served. FLSA-covered employers, who have been exempt from all but the certificate provisions, will be subject to the prohibitions on occupations declared detrimental by the Commissioner and to the alcoholic beverage restrictions.

Worker privacy. The law restricting the dissemination of information contained in city and county personnel records was amended to, among other things, authorize the release of information concerning specific personnel actions when it is determined in writing that the release is essential to maintaining public confidence in the administration of city or county services.

Labor relations. A new law was enacted prohibiting strikes by public employees.

Any State employee may voluntarily authorize, in writing, dues deductions for membership in a State employee's association, provided the association has at least 5,000 members and does not engage in collective bargaining.

North Dakota

Wages. Among other rights, persons with developmental disabilities performing labor of economic benefit for a public or private institution from which they are receiving treatment or other services, are entitled to receive wages commensurate with the value of the work performed and in accordance with applicable Federal and State laws.

Employees may not be discharged because their wages have been garnished for any reason (a prior law provides for protection against discharge as the result of wage assignment for child support payments). Also, wage garnishment for support payments will now be limited to 50 percent of disposable earnings if another spouse or child is being supported or 60 percent if not.

Court-ordered wage assignments and orders to withhold wages for child support payments are now subject to the limitations on withholding set by Federal law.

Ohio

Private employment agencies. Among several changes in the Private Employment Agency Licensing Law, maximum placement fees for jobs paying less than $13,000 annually are now set by statute. Registration fees were banned, restrictions designed to prevent misleading advertising were tightened, contracts with job applicants must be in writing, and placement fees must be refunded under specified circumstances.

Other laws. An employer may not discharge or threaten to discharge any permanent employee who is summoned for jury duty and who gives reasonable advance notice.

As part of a comprehensive surface mining control act, employers are prohibited from retaliating against employees filing a complaint or participating in any proceedings under the law.

Oklahoma

Wages. Among amendments to the prevailing wage law, Federal Davis-Bacon rates will now be used where available, a new procedure was adopted for rate determination in the absence of such rates, a Wage Appeals Board was established, and fringe benefits were added to the definition of a prevailing hourly rate of wages.

The required posting of a wage payment bond by coal mine employers was repealed.

Equal employment opportunity. The Civil Rights Act was amended to add discrimination because of handicap to the list of unfair employment practices. Such discrimination is prohibited unless the action is related to a bona fide occupational qualification. Handicapped person was defined to mean a person who has a physical or mental impairment which substantially limits the person's major life activities, has a record of such an impairment, or is regarded as having the impairment.

Labor relations. Principals and assistant principals in school districts with an average daily attendance of 15,000 or more will now constitute a separate entity for purposes of collective bargaining. An average daily attendance of 35,000 was previously required.

Other laws. A new law permits municipal employees to participate in political activities during off-duty hours if not in uniform, and if not prohibited from doing so by a Federal statute or municipal charter. Municipal corporations may establish employment requirements prohibiting employees from filing as a candidate for public office while employed by the municipality.

Oregon

Wages. As provided in a prior law, the minimum wage rate was increased from $2.90 an hour to $3.10 effective January 1, 1981.

The Wage and Hour Commission may no longer set a subminimum wage rate for persons over 65 years of age. Also, authority to adopt rules prescribing procedures and requirements for issuance of special certificates authorizing employment of student-learners at subminimum wages was transferred from the State Board of Education to the Commissioner of the Bureau of Labor and Industries.

Among other changes in the prevailing wage law, the labor commissioner may now seek an injunction against employers to prevent future failure to pay the prevailing wage or overtime pay. Awarding agencies must notify the labor department of contracts which are subject to the law. And the commissioner may take Federally-determined rates into consideration as part of the rate determination process. Also, once a public works contract is executed, the prevailing wage rate will not be subject to attack in any legal proceeding, and an employer-employee agreement cannot serve as a defense for paying less than the prevailing wage.

Agriculture. The labor commissioner or any person may seek an injunction to prevent the use of unlicensed farm labor contractors or to prevent anyone acting as a contractor from violating the law. Up to triple the $5,000 bond on deposit may now be required of license applicants with previously unsatisfied judgments. Workers must be furnished the names and addressess of owners of operations where they will be employed, and a notice of the existence of any labor dispute at the worksite. In addition, with each wage payment, they must receive a statement of hours worked and rate of pay, or, if on piece rate, rate of pay and pieces done.

Child labor. Nightwork restrictions were removed for children under age 16 employed under a special permit issued by the Wage and Hour Commission. Formerly, the permit prohibited work before 7 a.m. and after 10 p.m. (children without special permits may not be employed before 7 a.m. or after 6 p.m.).

A civil penalty of up to $1,000 may be imposed for each violation of the child labor law by employers who are not subject to FLSA. The penalties are payable to the labor commissioner, to be used for reimbursement of enforcement costs.

Equal employment opportunity. The maximum age for protection from age discrimination was increased from 65 to 70, and an amendment prohibits employment agencies from discriminating on any covered basis in classification or referral for employment except in the case of a bona fide occupational requirement.

The Vocational Rehabilitation Division or the Commission for the Blind may refer severely handicapped persons as applicants for vacancies in the State service. Such persons must be interviewed provided they meet the standards necessary to qualify for the position. The Personnel Division is to maintain a record of all handicapped individuals hired, and the Vocational Rehabilitation Division is to submit an annual statistical report on the employment progress of severely handicapped persons, along with recommendations for legislative action.

All State boards, commissions, and advisory bodies are to implement the State's policy of being a leader in affirmative action in making appointments. State agencies must submit their affirmative action objectives and performance to both the governor and legislature for review. They must also rate the effectiveness of managers in achieving affirmative action objectives.

Worker privacy. The Department of State Police may now make criminal offender information available to employers for employment purposes, provided the employer has first advised the employee or prospective employee that such information might be sought.

The law prohibiting employers from requiring a lie detector test as a condition of employment was expanded to include a breathalyzer test to detect the presence of alcohol. However, employers may require administration of such a test by a third party if there are reasonable grounds to believe the individual is under the influence of alcohol.

Occupational safety and health. The Director of the Workers' Compensation Department may require any public or private sector employer of 10 or more employees to establish and administer a safety committee if the employer has a rate of lost workday cases greater than that consistent with reasonable workplace health and safety for employees of that particular occupational classification.

The Workers' Compensation Department may not issue or enforce any occupational safety and health rules or standards with respect to farms on which temporary labor camps are not maintained and on which no more than 10 workers are employed, except that inspections and enforcement proceedings may be conducted in response to complaints relating to an accident, or relating to the issuance of a citation.

All amusement rides must be inspected annually by the Department of Commerce or a certified amusement ride inspector.

New procedures and requirements were enacted governing the transportation of hazardous materials within the State. A permit must be obtained to transport any material. Provision was made for requirements for notification, record keeping, reporting, packaging, and emergency response, and a civil penalty may be assessed by the circuit court upon complaint of any person injured by a violation of the law.

Private employment agencies. Agencies no longer must enter into written contracts with job applicants and prepare written job referrals for placements in which the employer pays the fee. The exemption from the law from employer-paid fee agencies now applies if no referrals are made to positions paying less than $50,000 per year instead of $30,000 as before.

Other laws. Employers are prohibited from discharging, demoting, suspending, or otherwise retaliating against an employee who has in good faith reported possible violations of the laws regulating health care and residential facilities.

Employers may not restrict access by authorized persons, including government officials, to any employer-provided employee housing, but may adopt reasonable rules concerning use and occupancy, including hours of access. Retaliation is prohibited against employees who report violations or confer with or invite to residential areas any authorized or otherwise invited person.

Pennsylvania

Wages. By previous enactment, the minimum wage was increased from $3.10 an hour to $3.35 effective January 1, 1981.

Rhode Island

Wages. As provided for in a prior law, the minimum wage rate was increased from $2.90 an hour to $3.10 effective July 1, 1981 with a future increase to $3.35 scheduled for July 1, 1982.

State overtime pay requirements no longer apply to motor carrier employees whose maximum hours of work are regulated under the Federal Motor Carriers Act.

Guaranteed daily pay was reduced from 4 hours to 3 for employees who report for duty with the employer's permission but who are not furnished work of that duration.

Violators of the prevailing wage law will not be allowed to bid on or be awarded any public works contract for a period of 18 months.

The wages of State and local government employees are now subject to garnishment. Retirement benefits and contributions will be exempt.

Hours. The law governing required meal periods was extended to men in addition to women and children as before.

Equal employment opportunity. Back pay, in cases where unlawful employment practices are found, was defined to include the economic value of all benefits and wage increases an employee would have been entitled to had an unfair employment practice not been committed.

Discrimination in employment will now be prohibited based on mental impairment as well as physical handicap. The definition of handicap was amended to refer to physical or mental impairment which substantially limits major life activities.

Labor relations. The law giving certified public school teachers the right to organize and bargain collectively was amended to specifically include certified support personnel whose positions require a professional certificate issued by the State Department of Education. Supervisors above the rank of assistant principal are excluded from coverage.

Other laws. A number of State agencies scheduled to be abolished between June 30, 1981 and June 30, 1985, under prior sunset legislation, were continued, including the Labor Relations Board, the Governors Committee on Employment of the Handicapped, the Apprenticeship Council, and the Commission for Human Rights.

South Carolina

Labor relations. Amendments to the public-sector law, relating to permissible payroll deductions for contributions to eligible charitable organizations and credit unions, were made specifically inapplicable to deductions for labor organizations.

Private employment agencies. Licensing and enforcement under the employment agency law were removed from the Department of Labor, and administrative authority to issue rules and regulations, conduct investigations and hearings, suspend and revoke licenses, and levy fines, was deleted. Licenses will now be issued by the Secretary of State, and enforcement is by court action.

South Dakota

Wages. Parents may be directed to pay a specific portion of wages indirectly, from the parent's employer to the entitled child, in child support cases.

Private employment agencies. The law providing for the licensing and regulation of private employment agencies was repealed.

Employment and training. The Department of Social Services was directed to develop a workfare program to provide useful public service work for unemployed individuals who receive public assistance. Refusal to participate can result in the termination of aid.

Tennessee

Wages. Courts may require an assignment of wages as part of an order to enforce child support, and employers may not discharge or discipline an employee on the basis of the wage assignment.

Equal employment opportunity. Handicapped applicants for State employment who are certified as unable to take a written examination, may instead be given a work-test period during their normal probation time.

Labor relations. The law governing payroll deductions for employee association dues for State employees was amended. Among other things, it now provides that a State employee who participates in, authorizes, or encourages a work stoppage will be guilty of gross misconduct, and will permanently forfeit the automatic deduction of membership dues previously authorized.

Other laws. The prohibition against Sunday employment was repealed.

Texas

Agriculture. Licensing requirements for labor agents were amended to exclude farm labor contractors registered under the Federal Farm Labor Contractor Registration Act.

The use of short handled hoes in performing agricultural labor in commercial farming operations was prohibited, with the exception of work in greenhouses or nurseries.

Child labor. Effective January 1, 1982, the existing child labor law will be replaced by a modernized law with several new features. Fourteen will be the basic minimum age for employment, with certain exceptions. Exempt employment includes newspaper delivery, agricultural employment when school attendance is not required, casual employment with parental consent, parent-supervised work in a family business, and work study participation. The labor commissioner will be required to declare occupations hazardous for minors under 18. Other new provisions relate to hours of work restrictions, age certificates, and granting the labor commissioner authority for rulemaking, inspections, and the issuance of variances in hardship cases.

Equal employment opportunity. Examiners in the public or private sector who are testing handicapped adult job applicants may use alternate forms of testing, including any procedure or adaptation to help ensure the applicant's best performance possible, including oral or visual testing, use of readers or tape recorders, removal of time limits, and use of multiple testing sessions.

A Committee on Purchases of Products and Services of Blind and Severely Disabled Persons was established, to facilitate the purchase by State agencies and political subdivisions of goods and services produced by handicapped individuals. The committee is authorized to adopt procedures, practices, and standards used for similar Federal programs.

Worker privacy. Limitations were placed on the disclosure of information obtained from a polygraph examination, and new penalties were enacted in the event of violation.

A school district may obtain the criminal history record of any applicant for employment from any law enforcement agency, provided it has written authorization from the applicant.

Occupational safety and health. Effective January 1, 1983, all State, county, and municipal full-time paid firefighters must be provided with protective clothing meeting minimum standards, and as of January 1, 1982, all self-contained breathing apparatus must be approved and certified, and tested at least every 30 days.

Other laws. The right of employees to attend a precinct convention of a political party without penalty was extended to include any county, district, or State convention to which the employee is a delegate. Employees need not be paid for any such time lost.

Utah

Wages. An increase in the minimum wage to $2.75 an hour, authorized by a 1978 administrative action, took effect on January 1, 1981, for the retail trade, public housekeeping, restaurant, laundry, cleaning, dyeing, and pressing industries in Salt Lake, Weber, Utah, and Davis counties, and in all cities with populations of 5,000 or more. The minimum wage for other areas was raised to $2.50 an hour.

The prevailing wage law was repealed, over the governor's veto. A similar measure in 1979 was defeated when the governor's veto was sustained.

The $400 limitation on wage claims considered preferred debts of a business in receivership was raised to $1,000, and the Industrial Commission may now award reasonable attorney's fees in addition to amounts due for wages.

Equal employment opportunity. Authority was given the Director of the Department of Finance to contract with various veteran's organizations to provide assistance to veterans, and their widows and children, especially those in the outlying areas of the State, by disseminating information on veteran's rights and benefits under State or Federal laws, on employment or reemployment of veterans, on preference for employment, and on emergency relief.

Worker privacy. The polygraph regulatory law governing use of equipment, and licensing of examiners was expanded to apply to all deception detection instruments, including voice stress devices. All instruments must have prior approval of the Department of Public Safety, and additional safeguards were prescribed to protect the subject. Denial or termination of employment may not be based on refusal to submit to any such examination.

Employment and training. The State Apprenticeship Council will permit apprentices to substitute prior educational experience in a trade for supplemental instruction if the apprentice passes an equivalency test administered by an accredited school.

Vermont

Wages. By prior law, the minimum wage rate was raised to $3.35 an hour effective January 1, 1981.

Equal employment opportunity. The anti-discrimination law was amended to prohibit discrimination in employment based on age (18 or older), or for physical or mental condition. A separate provision which had provided some limited protection for physically handicapped persons was repealed. Mandatory retirement because of age is prohibited, except under a police or firefighter retirement system, and except that institutions of higher learning may retire a tenured employee at age 65 (70 after July 1, 1982).

Employment and training. The name of the Department of Employment Security was changed to the Department of Employment and Training, and a new Comprehensive Employment and Training Office was created within it. The new office will provide job training and employment opportunities for economically disadvantaged, unemployed, or underemployed persons through a system of Federal and State programs, serving as a prime sponsor in accordance with the Comprehensive Employment and Training Act, so long as Federal funding continues.

Virginia

Child labor. Minors participating in the activities of a volunteer rescue squad were exempted from the child labor law.

Labor relations. Collective bargaining contracts entered into by the Washington Metropolitan Area Transit Authority must hereafter prohibit strikes or lockouts. Binding arbitration to settle a bargaining impasse was replaced with procedures for mediation, and if mediation is unsuccessful, for advisory fact finding.

Occupational Safety and Health. The owner or operator of a company constructing a shaft or slope coal mine is now required to provide classroom and on-the-job training for workers hired on or after July 1, 1981, who have not had previous training or comparable experience in similar mine construction work.

Internal combustion engines will no longer be permitted underground in any coal mine. They were previously allowed with the written approval of the Chief of the Division of Mines.

Employment and training. The Apprenticeship Council was transferred to the Department of Labor and Industry.

Other laws. An employer may not discharge a person summoned to serve on jury duty, nor require the employee to use sick leave or vacation time, provided the employer was given reasonable notice of the summons.

Virgin Islands

Wages. As the result of a wage order, effective in 1979, the minimum wage rate was automatically increased from $3.10 an hour to $3.35 on January 1, 1981 for non-tipped employees. A few individual occupational rates, established under earlier wage orders, which are higher than the $3.35 rate remain in effect. The minimum rate for most agricultural employees rose from $2.87 to $3.17.

Washington

Wages. For public works contracts over $10,000, contractors must now post at the job site a copy of a statement of intent to pay prevailing wages, a copy of the rates determined for each classification of workers, and the address and telephone number of the Industrial Statistician of the Department of Labor and Industries where complaints or inquiries may be filed.

The exemption from wage garnishment was amended to now include any amount that is exempt under Federal law in addition to the prior exemption prescribed by State law, whichever is greater.

Equal employment opportunity. The Department of Employment Security is to conduct employer awareness seminars to ensure private-sector employer knowledge and support for veterans' employment programs. At least one seminar is to have direct impact upon incarcerated veterans.

West Virginia

Wages. The minimum wage rate was increased from $2.75 an hour to $3.05 effective January 1, 1982, and certain employees of the legislature were exempted from coverage of the law.

The wage payment and collection law was extended to include fringe benefits in the same manner as wages. Employers are to pay wages and fringes within 5 days after they are due instead of 20 days before. Also, wage payment bonds will be required of all employers engaged in construction work or mining except for those who have been doing business in the State for at least 5 consecutive years. The Commissioner of Labor may waive or terminate the bond requirement upon determining that an employer is of sufficient financial responsibility to pay wages and fringe benefits.

Child labor. Children age 16 to 18 may work for volunteer fire departments if they have the proper training and written parental consent. They are not to operate fire-fighting vehicles, enter a burning building, or engage in other dangerous activities unless under the immediate supervision of a fire line officer.

Equal employment opportunity. The Human Rights Act was amended to prohibit discrimination in employment, public accomodations, and housing on the basis of handicap, in addition to blindness, the only previous prohibition.

A new law prohibits forced retirement prior to age 70 of college or university professors with unlimited tenure.

Occupational safety and health. The Commissioner of Labor is to establish and maintain a list of up to 600 chemical substances and materials which have been determined or are suspected to be hazardous or toxic to the health of employees. Employers of ten or more are to post a warning notice in the work area where any such substance or material is used, and all employers are to report incidents of over-exposure by employees within 10 days. The law does not apply to coal mining or processing or any agricultural or horticultural activity.

A Hazardous Waste Management Act was passed to provide for regulation of the storage, transportation, treatment, and disposal of hazardous waste by the Department of Natural Resources.

Coal mine operators must develop and submit for approval of the Director of the Department of Mines, under regulations to be established, a comprehensive safety program for each mine. Employees of each mine must be given a chance to review the plan and submit comments to the Director before its submission.

All surface mine employees must now wear approved safety helmets when working in areas of possible danger of head injury, unless operating machinery with adequate cab protection.

Other laws. The Department of Labor, scheduled to terminate on July 1, 1981 under sunset legislation, was continued until July 1, 1987.

Wisconsin

Wages. By prior administrative action, the nonfarm minimum hourly wage rate was increased from $3 to $3.25 effective January 1, 1981. The farm rate was increased from $2.80 an hour to $3.05.

Wyoming

Wages. Employees whose payroll records are maintained outside the State and who quit or are discharged must now be paid within 72 hours of termination instead of 48 hours as before.

Assignment of up to 25 percent of a parent's earnings is permitted in cases where support payments are more than 60 days overdue. The employer may deduct an additional $2 for each payment made for costs incurred in administering the assignment. An employee may not be discharged because of the assignment.

Private employment agencies. Placement services of the University of Wyoming were specifically exempted from the private employment agency regulatory law.

Occupational safety and health. Controlled substances and persons under their influence are now banned in or around mines, aside from the previous ban on liquor.

The Department of Fire Prevention and Electrical Safety, scheduled to be abolished on July 1, 1981, under sunset legislation, was continued for 6 years. ☐

Reconciling the CPI and the PCE Deflator: an update

JULIE A. BUNN AND JACK E. TRIPLETT

In an article in the September 1981 issue of the *Monthly Labor Review*,[1] a technique was developed for determining the effect of differences in index number construction on the measurement of inflation. The technique permits a straightforward reconciliation of the Federal government's two major inflation measures—the Consumer Price Index (CPI), published by the Bureau of Labor Statistics, and the Implicit Price Deflator for Personal Consumption Expenditures (PCE Deflator), produced by the Bureau of Economic Analysis. This update advances the reconciliation to the third quarter of 1981.

Differences between movements in the CPI and PCE inflation measures can be attributed to three factors: owner-occupied housing, different index weights, and "all other" factors. By comparing alternative versions of the indexes published by the Bureau of Labor Statistics and the Bureau of Economic Analysis (the Federal Government currently publishes ten aggregate consumption expenditure price measures), the difference between the CPI and PCE measures can be decomposed into these three categories.

For technical reasons, two reconciliations are necessary.[2] The first reconciliation addresses the question: "What are the reasons the CPI and PCE price measures show different rates of change from one period to the next?" The second answers the question: "What accounts for the cumulative divergence in the CPI and PCE measures since 1972?"

Reconciling period-to-period changes

Table 1 shows the reconciliation of period to period percent changes in the Consumer Price Index for All Urban Consumers (CPI-U) and "PCE: Chain-Weight" index. The Implicit PCE Deflator, a Paasche-formula index, cannot be used for this reconciliation because Paasche formulas lend themselves to statistical interpretation only when referring back to the base year (in this case, 1972).[3]

In most recent quarters, the CPI-U has recorded a greater price change than the "PCE: Chain-Weight" index. The difference between the two seems to be diminishing from the historically high values of 1979–80. The exception to this statement occurs in the third quarter of 1981, in which the difference between the two surged to 3.3 percentage points.

In nearly every case, the treatment of owner-occupied housing accounts for most of the difference between the CPI and PCE price measures. For example, alternative treatments of housing accounted for 3.1 percentage points of the total 3.3 point differential in 1981's third

Table 1. "Reconciliation" of annual and quarterly percent changes in the CPI-U and the Personal Consumption Expenditure price measures, 1979–81

Difference	1979	1980	1980[1], [2]				1981[2]		
			I	II	III	IV	I	II	III
CPI-U[3]	11.3	13.5	16.5	13.1	7.7	12.9	10.8	7.5	12.0
PCE: Chain-Weight[4]	9.3	10.6	12.5	9.7	9.5	10.1	10.3	6.5	8.7
Total difference[5] . . . . (CPI-U minus PCE: Chain-Weight)	2.0	2.9	4.0	3.4	-1.8	2.8	0.5	1.0	3.3
Housing treatment[6] . .	1.7	2.3	3.2	3.2	-1.9	2.2	0.0	0.2	3.1
Weighting effect[7] . . .	0.3	0.4	0.7	0.2	0.0	0.0	0.6	0.0	-0.5
"All other" effect[8] . . .	0.0	0.2	0.1	0.0	0.1	0.6	-0.1	0.8	0.7

[1] Owing to changes in seasonal adjustment factors, the 1980 quarterly figures may differ slightly from those which appeared in table 3, p. 9, in the September 1981 *Monthly Labor Review*.

[2] Seasonally adjusted annual rates.

[3] Annual and quarterly changes in the CPI-U are taken from tables provided by the Office of Prices and Living Conditions, Bureau of Labor Statistics (BLS). The changes are compiled from 1967 based indexes.

[4] Data for the "PCE: Chain-Weight" were obtained from the Bureau of Economic Analysis (BEA), U.S. Department of Commerce. The data incorporate revisions released by BEA in April 1981.

[5] CPI-U minus "PCE: Chain-Weight" equals the sum of "housing treatment", "weighting" and "all other" effects.

[6] Change in CPI-U minus change in CPI-X1. See September 1981 *Monthly Labor Review*, p. 21, for fuller explanation. Source of CPI-X1 data is same as footnote 3.

[7] Change in "PCE: 1972-Weight" minus change in "PCE: Chain-Weight". See September 1981 *Monthly Labor Review*, pp. 8–9, for fuller explanation. Data source for "PCE: 1972-Weight" changes is same as for footnote 4.

[8] Change in CPI-X1 minus change in "PCE: 1972-Weight". See September 1981 *Monthly Labor Review*, p. 6, for fuller explanation.

Julie A. Bunn is an economist in and Jack E. Triplett is Assistant Commissioner of the Office of Research and Evaluation, Bureau of Labor Statistics.

quarter, and in quarters in which the total difference between the two price measures was low (1980–III, 1981–I, 1981–II), so was the housing effect.

Note we estimated the housing treatment effect by comparing the two BLS indexes which are published monthly and which have different treatments of housing. In October, the BLS announced plans to change the treatment of housing to more nearly approximate a rental equivalence treatment in the CPI-U index, beginning in January 1983.[4]

Weighting effects have behaved erratically and unpredictably over recent quarters. Generally, one expects that the longer the interval between weights, the greater the weighting effect in the price index. This expectation has been true of most CPI-PCE comparisons in the past.[5] However, the size of the weighting effect became noticeably smaller in the last half of 1980, and except for the first quarter of 1981, has contributed very little to CPI-PCE differences for over a year. In 1981 III, the index with 1981 weights (actually 1981 II weights) showed higher inflation than did the index with 1972 weights, so the weighting effect was negative (minus 0.5 percentage points), a surprising result.

"All other" factors are the sum total of computational and compilation differences in which the CPI and PCE indexes differ (that is, everything other than the period for which the weights were drawn, and the treatment of owner-occupied housing). The "all other" effect has typically been small in the past.[6] The precise source of the "all other" effect has not been identified, but seasonal adjustment methods undoubtedly are important.

Table 2. "Reconciliation" of the CPI-U and the Personal Consumption Expenditure price measures: cumulative percent change from 1972 to the date shown (1979–81)

Difference	1979	1980	1980[1] I	II	III	IV	1981 I	II	III
CPI-U (1972=100)[2]	173.6	197.0	189.3	195.3	199.0	205.1	210.4	214.3	220.4
PCE Deflator (1972=100)[3] (Current-Weight)	162.3	178.9	172.9	177.0	180.7	184.9	188.5	191.5	195.7
Total difference[4] (CPI-U minus PCE Deflator)	11.3	18.1	16.4	18.3	18.3	20.2	21.9	22.8	24.7
Housing treatment[5]	7.0	11.7	10.6	12.3	11.8	13.1	13.3	13.7	15.5
Weighting effect[6]	3.7	5.4	4.9	5.1	5.6	5.9	7.3	7.4	7.1
"All other" effect[7]	0.6	1.0	0.9	0.9	0.9	1.2	1.3	1.7	2.1

[1] Owing to changes in seasonal adjustment factors, the 1980 quarterly figures may differ slightly from those which appeared in table 4, p. 10, in the September 1981 *Monthly Labor Review*.

[2] Annual data for the CPI-U were computed by the Office of Research and Evaluation (BLS) from unadjusted monthly data provided by the Office of Prices and Living Conditions (BLS). The quarterly data for 1980 and 1981 were computed by the Office of Research and Evaluation employing seasonally adjusted monthly data provided by the Office of Prices and Living Conditions.

[3] Data for the Implicit PCE Deflator, or "PCE: Current-Weight" index, were provided by the BEA. The data incorporate revisions released in April 1981.

[4] CPI-U minus PCE Deflator equals the sum of "housing treatment", "weighting" and "all other" effects.

[5] CPI-U minus CPI-X1. See September 1981 *Monthly Labor Review*, p. 5, for fuller explanation. Data source for the CPI-X1 is the same as footnote 2.

[6] "PCE: 1972-Weight" minus "PCE: Current-Weight". See September 1981 *Monthly Labor Review*, p. 6, for fuller explanation. Data source for the "PCE: 1972-Weight" is same as footnote 3.

[7] CPI-X1 minus "PCE: 1972-Weight". See September 1981 *Monthly Labor Review*, p. 6, for fuller explanation.

Table 3. Relative distribution of CPI-PCE reconciliation factors, 1979–81[1]

Factor	1979 Index points	1979 Percent	1980 Index points	1980 Percent	1981[2] Index points	1981[2] Percent
Total difference	11.3	100	18.1	100	23.1	100
Housing treatment	7.0	62	11.7	65	14.2	61
Weighting effect	3.7	33	5.4	30	7.3	32
"All other" effect	0.6	5	1.0	6	1.7	7

[1] Data based on table 2.

[2] Average of first three quarters.

Reconciling cumulative changes

Table 2 shows the reconciliation of the CPI-U and the Implicit Price Deflator (PCE: Current-Weight) index levels, with 1972=100. The cumulative effect created by differences in owner-occupied housing treatment from 1972 to 1981 third quarter amounted to 15.5 index points, which is roughly 13 percent of the inflation over this interval, as measured by the CPI-U. As expected, the cumulative effect of updating weights in the price measures increases in index points as the periods providing the comparisons grow further apart. The 7.1 index number difference for the third quarter of 1981, however, accounts for only roughly 7 percent of the measured inflation from 1972 to that quarter (as recorded by the PCE measures). When computed as a percentage of the inflation that has occurred since 1972, both the housing treatment and weighting effects have grown somewhat larger in recent quarters.

As a percent of the total difference between the CPI-U and PCE Deflator in any particular period, however, all three categories have maintained roughly their same proportions to the total difference. These proportions are shown in table 3.

In summary, housing treatment continues to account for most of the difference between the CPI and PCE inflation measures. The effects of updating weights and "all other" factors play a much less significant role. □

Area labor market response to national unemployment patterns

ROBERT W. BEDNARZIK AND RICHARD B. TILLER

Unemployment varies widely among geographical areas in the United States. In 1980, the rate of joblessness ranged from a high of 8.2 percent in the North Central region of the country to a low of 6.4 percent in the South. (The unemployment rates in the two remaining major census regions—the Northeast and the West—were near the national rate of 7.1 percent.) The concern of policymakers with the sensitivity of regional labor markets to national economic conditions has generated a number of time series studies of the impact of national fluctuations in unemployment on regional jobless rates.[1]

Such studies measure regional sensitivity as the change in regional unemployment rates relative to the change in the national average rate. During recessionary periods, differences in regional sensitivities to national fluctuations imply that unemployment rates in some areas will rise faster than the national average. Thus, deflationary policy measures targeted at selected national economic aggregates may unintentionally impose a disproportionately large share of the recessionary burden on some regions. Conversely, during periods of national full employment, differences in sensitivities mean that some areas may experience far greater labor demand pressures, and consequent wage inflation, than others. Over the longer run, differences in the magnitude of changes in area rates relative to the national average may indicate growing structural imbalances (such as deterioration in the competitive position of industries in certain regions) of which the policymaker should be aware.

Heretofore, most research has focused only on short-run relationships among unemployment series. We undertook a study which used a time series model that distinctly characterized the sensitivity of regional unemployment to both short- and long-run fluctuations in national unemployment during 1967–80.[2] For our purposes, the short run is defined as that period within which business cycles occur. We used the National Bureau of Economic Research designation of the length of post-World-War II business cycles as a guide for defining the length of our cyclical component. Within our sample period, these cycles ranged in length from approximately 2 to 7 years. The long run refers to periods of more than 7 years.

Thus, we were able to explore several questions requiring the separation of short-run (business cycle) from long-run (secular) developments: Are there major geographical differences in the importance of short- and long-run cycles in unemployment? How do various regional and local labor markets differ in their sensitivity to fluctuations in national unemployment? And, are areas responsive to national business cycles also sensitive to secular changes in the national unemployment rate?

Subnational unemployment rate data were analyzed using a spectral approach, whereby each series was broken down into its component cycles and trends to determine which of these movements exerted the most influence on the original series. This method also permits the estimation of the sensitivity of the components of one series to the corresponding components of other series. For example, we can estimate the sensitivity of the components of regional unemployment to the corresponding components of the national unemployment rate series. Thus, we can assess not only the impact of aggregate national developments on regional labor markets but also the extent to which a region exhibits its own independent business cycle or secular movements. There has been longstanding argument as to whether independent area business cycles can exist in a highly interdependent economy such as ours.

Data and methodology

Our sample consisted of monthly unemployment data from the Current Population Survey (CPS) covering the period January 1967–June 1980 for census regions and divisions, and for the 15 most populous States. (See exhibit 1.) January 1967 is the earliest date for which such information is available for subnational areas.[3] Unemployment estimates for previous studies of data for earlier periods were based on counts of unemployment insurance benefit claimants, inflated to represent total unemployment for an area using the so-called "Handbook procedure." However, this technique is known to produce biased results, particularly for business cycle analyses.[4]

In our model, regional unemployment rates were broken down into four major components:[5] (1) a national cyclical component, which measures short-run fluctuations related to the national business cycle; (2) a regional cyclical component, reflecting short-run fluctuations that are independent of the national business cycle; (3) a national secular measure of long-run national trends; and (4) a regional secular component, which tracks long-run area developments that are independent of national trends.

Robert W. Bednarzik is an economist in the Division of Employment and Unemployment Analysis, Bureau of Labor Statistics. Richard B. Tiller is an economist in the Bureau's Division of Local Area Unemployment Statistics.

Regional differences in joblessness generally reflect both aggregate supply and demand considerations. Specifically, the long-run trend of output and employment in a particular region is primarily determined by supply, which is in turn governed by the growth of labor, capital, and technology. Short-run fluctuations, on the other hand, reflect the ups and downs in consumer and business demand or, in some instances, temporary capacity bottlenecks on the supply side.

Thus, we can roughly separate the forces that affect regional unemployment rates into: (1) those caused by changes in aggregate demand or by capacity constraints, which appear as short-run cycles in the regional unemployment rate series; and, (2) those that originate largely on the supply side of the labor market and are reflected as long-run trends. At the regional level, we can further distinguish between shifts in demand and supply that originate within and outside the region.

[1] One of the 15 most populous States.

Links between unemployment series

During 1967–69, the first 3 years of the sample period, the national unemployment rate was slightly below 4 percent. It then rose sharply, reaching nearly 6 percent in 1971. Subsequently, joblessness remained between 4.5 and 6 percent until 1975, when it jumped to 9 percent. Thus, over the period studied, the national rate was characterized by a long upward movement, as well as by major short-run fluctuations. In fact, the 1967–80 period encompassed two complete business cycles, including the most severe contraction in the postwar era, and the first phase of a third cycle.

The secular rise in the national jobless series has prompted economists to continually revise upward their estimates of the national rate for "full employment." A number of labor supply factors have been offered as possible explanations for this rise, including demographic changes in the composition of the labor force, expanded income transfer programs, increases in the minimum wage, and growth in the number of multiworker families. The quantitative importance of these factors, however, remains to be established.[6]

Secular and cyclical forces. The relative importance of cyclical and secular movements in each area unemployment series is shown in table 1. Columns 1 and 4 provide the proportions of the total combined variation in national and regional unemployment due to secular and cyclical forces, respectively. The national series (columns 2 and 5) is given as a point of reference; its secular component accounts for 51 percent of the variation, compared to 40 percent for the cyclical component. This highlights the importance of the long-run trend in the national unemployment rate. The national pattern must, of course, be reflected in the regional unemployment rate series, because the former is a weighted average of the latter.

For all regions, 7 of the 9 divisions, and 11 of the 15 States, the secular component contributes more to variance than the cyclical component. However, there is considerable difference among areas in the relative size of the secular component, which ranges from a high of 57 percent in the Middle Atlantic division to a low of 37 percent in the Mountain and East South Central sections. The range for the 15 largest States is slightly wider, from 58 percent for New York to 33 percent for Indiana.

While generally smaller than the secular component, the cyclical component nevertheless accounts for a sub-

[1] The percentages for the secular, cyclical, and seasonal components of a series do not add to 100 because there is other variation (principally random) not accounted for.

[2] The national and regional subcomponents may not add to the total because of rounding.

stantial portion of the variance. In fact, cyclical variation in joblessness in the East North Central division and 3 of its 5 States—Indiana, Michigan, and Ohio—was even greater than the secular variation. This was also the case for North Carolina. Cyclical variation as a percent of the total was smallest for Virginia and Missouri.

Table 1 also indicates the relatively minor contribution of independent regional cycles to total variance.[7] Column 6 provides the portion of the variance accounted for by the independent cyclical component of regional unemployment. In three States—Indiana, North Carolina, and California—this component was 8 to 10 percent of the total variance in the unemployment rate series, accounting for more variation than the seasonal movements (column 7). In the remaining 12 States, the regional cyclical component was 5 percent or less of the variance. Clearly, national fluctuations account for most of regional cyclical unemployment patterns.

On the other hand, there is evidence that distinct regional business cycles, although relatively small, do exist. Some have asked how such cycles could develop. In a highly interdependent economy such as ours, one might expect economic impluses to be diffused rapidly, and that there would thus be strong conformity between regional and national business cycles. But, in fact, these cycles may be normal by-products of a dynamic economy.

For example, it has been established that random events in time series can generate wavelike movements with business cycle properties.[8] At the regional level, unexpected changes in relative demands for goods and services become shocks to the labor market, the effects of which tend to persist because the supply of labor adjusts slowly to new conditions. However, these random disturbances tend to cancel out in the aggregate. That is, shocks in one region tend to be offset by countershocks in other regions. For example, assume there is a country with an area whose economy depends upon the production of slide rules, while in another area of the same country a new industry develops that produces pocket calculators. Suddenly, the demand for slide rules falls and that for pocket calculators rises. It is entirely possible that, at the national level, these changes would be offsetting. But because it takes time for an area to switch production emphasis (either to producing more or less), local business cycles may persist for a while, independent of national movements. Only when such shocks accumulate in one direction are national business cycles generated.

Of course, this also implies that the larger the regional economy, the less important will be independent regional business cycles, because internal shocks tend to average out. This hypothesis is supported by our observation that the smaller the area, the larger the independent regional cyclical component—3 percent for census regions, 4 percent for census divisions, and 5 percent for the 15 States.

The independent secular component of regional unemployment (column 3 in table 1) is relatively weak. And, on average, independent long-run regional fluctuations account for only 3 percent of the total variation in the State unemployment rates. California, at 9 percent, is the one notable exception; Virginia followed at 6 percent. Based on these statistics, it would appear that area labor markets conform to long-run national developments, rather than manifesting their own distinctive secular trends.

Sensitivity of regional to national unemployment. Our technique also provides estimates of the sensitivity of the components of regional unemployment to corresponding components in the national series.[9] These estimates are presented in table 2. The larger the index value, the greater is the amplitude of the national component in the regional unemployment rate series. For a secular index value greater than 1, this implies a tendency for a region's unemployment rate to rise above that of the Nation during a long-run upswing in the national rate and to remain there for an extended period. This was the case for the jobless pattern in the Northeast, which was very sensitive to the national unemployment rate trend. In the other three census regions, the index was less than 1, indicating a tendency for the long-run rise in the regional rate to be less than that in the national rate.

Of the nine census divisions, the Middle Atlantic and New England States were the most sensitive to long-run national patterns. The South Atlantic and East North Central divisions have index values very close to 1, indicating that the amplitude of the secular component of their unemployment rates was roughly the same as that of the corresponding national component. Among the 15 largest States, Massachusetts and New Jersey were the most sensitive, as were the divisions in which they are located. On the other hand, jobless patterns in Florida and Michigan were somewhat unique in that they were much more sensitive to the national rate than were their divisions. Texas and the West South Central area ranked by far the lowest in degree of sensitivity to the national rate.

Turning to the cyclical component (column 2, table 2), the jobless pattern in the Northeast was the most sensitive to national business cycles, while those of the South and the West were least sensitive. The North Central index value, which is close to 1, suggests that national business cycles tend to be transmitted to this region with unchanged amplitude. However, this essentially results from the counterbalancing unemployment relationship between its two divisions: Jobless patterns in the East North Central division were very sensitive to national business cycles, while those in the West North Central division were not.

Table 2. Amplitude of national secular and cyclical components in area jobless series, and mean unemployment rate, 1967–80

Area	Index value		Mean unemployment rate (3)
	Secular (1)	Cyclical (2)	
United States	1.00	1.00	5.7
Northeast	1.50	1.38	6.2
New England	1.50	1.42	6.0
Massachusetts	1.73	1.56	6.2
Middle Atlantic	1.50	1.37	6.2
New Jersey	1.72	1.53	6.9
New York	1.63	1.48	6.5
Pennsylvania	1.15	1.11	5.8
North Central	.87	.99	5.2
East North Central	.99	1.15	5.7
Illinois	.89	.93	5.0
Indiana	.84	1.17	5.4
Michigan	1.35	1.66	7.9
Ohio	.93	1.15	5.7
Wisconsin	.81	.83	4.5
West North Central	.60	.61	4.0
Missouri	.83	.79	4.6
South	.81	.82	5.2
South Atlantic	1.04	.99	5.2
Florida	1.50	1.37	5.9
North Carolina	.72	.98	4.9
Virginia	.76	.68	4.4
East South Central	.66	.81	5.4
West South Central	.53	.57	4.9
Texas	.52	.54	4.5
West	.79	.84	6.8
Mountain	.60	.65	5.6
Pacific	.86	.91	7.2
California	.86	.90	7.2

There is a broad range of sensitivity to the national business cycle in the jobless patterns of the 15 largest States; indexes ranged from a high of 1.66 in Michigan to a low of 0.54 in Texas. Index values dropped off rapidly, with Massachusetts and New Jersey following Michigan. At the lower end of the sensitivity spectrum, Virginia was the only State relatively close to Texas.

Generally, if an area was sensitive to national secular patterns, it was also sensitive to national business cycles. Indiana was the only clear-cut exception, being responsive only to national secular developments.

Interpretation of results

There is no unified theory of the determinants of a region's response to national cycles and trends. Differences in industry mix, local multiplier effects (propensities of residents to spend their income outside their home region), competitive market strengths, layoff policies,[10] unemployment insurance benefit levels,[11] labor force composition, growth,[12] and inflationary impacts[13] have all been cited as likely causes of the variance in regional jobless patterns.

Our findings indicate that the unemployment patterns in the New England and Middle Atlantic divisions and selected States in the East North Central division were affected more strongly than those in other areas by national economic trends over the period under study. Most States in these divisions tend to be highly sensitive to both short- and long-run national developments. These divisions comprise what geographers call the "manufacturing belt"—an area characterized by cyclically sensitive durable goods industries. For example, Michigan, which is dominated by the automobile industry, exhibited the highest cyclical sensitivity among the States studied.

At the same time, long-run structural factors may have resulted in a deterioration in the competitive position of the manufacturing belt, in which most of the older central cities are located. Aging capital and rising energy prices appear to have rendered these areas less viable for manufacturing.

In contrast, California was neither cycle- nor secular-sensitive, exhibiting the most independence from national patterns. In fact, there was some evidence that California may have a cycle of its own.

With few exceptions, independent regional cycles, although in evidence, contributed very little to regional fluctuations. And systematic leads or lags in regional unemployment rates relative to the national rate could not be detected. Apparently, national aggregate supply and demand disturbances are quickly transmitted throughout the economy, and both short- and long-run changes in regional labor market conditions conform closely to national developments. Regions do differ, however, in the degree of their sensitivity to changing national conditions. But generally, areas that are responsive to national secular trends are also sensitive to national business cycles. □

FOOTNOTES

A number of European and Canadian studies followed Brechling's approach; see, for example, C.P. Harris and A.P. Thirwall, "Interregional Variations in Cyclical Sensitivity to Unemployment in the UK 1949–1964," *Bulletin Oxford University Institute of Economics and Statistics*, February 1968, pp. 55–56; J.J. Van Duijn, "The Cyclical Sensitivity to Unemployment of Dutch Provinces," *Regional Science and Urban Economics*, May 1975, pp. 107–32; and L.J. King and G.L. Clark, "Regional Unemployment Patterns and the Spatial Dimensions of Macro-Economic Policy: The Canadian Experience 1966–1975," *Regional Studies*, 1978, pp. 283–96. Similar U.S. studies include Robert M. Fearn, "Cyclical, Seasonal, and Structural Factors in Area Unemployment Rates," *Industrial and Labor Relations Review*, April 1975, pp. 424–31, and Thomas Hyclak and David Lynch, "An Empirical Analysis of State Unemployment Rates in the 1970's," *Journal of Regional Science*, No. 3, 1980, pp. 377–86.

[2] Richard B. Tiller and Robert W. Bednarzik, "A Detailed Analysis of Regional and State Unemployment Patterns in the U.S.: 1967–1980," unpublished paper presented at the Atlantic Economic Society meetings, October 1981.

[3] During the first 3 years of our sample period, the national unemployment rate, while lower than for earlier years in the decade, was near full employment (4 percent). In subsequent years, the unemployment rate at full employment was redefined substantially upward. Thus, although our sample starts at a somewhat lower than average national jobless rate, the distortion effects on our estimate of the secular component of unemployment rates should be small.

[4] See Richard Tiller, "An Exploratory Time Series Analysis of Errors in Area Estimates of Unemployment," *Proceedings of the Business and Economic Statistics Section of The American Statistical Association*, 1979, pp. 165–69, for more detail.

[5] This is done using spectral analysis, which is a time series analysis technique in the frequency domain whereby a series is decomposed into uncorrelated (random) components according to frequencies. "Frequency" simply refers to the fraction of a cycle completed in a given period. The spectrum at a particular frequency represents the contribution of that frequency to the total variation of the series. This method of analysis is quite general in that it does not require strong assumptions concerning the properties of the series being decomposed. A more complete description of the procedures used to develop the discussion in this article is available from the authors upon request.

[6] See, for example, Paul O. Flaim, "The effect of demographic changes on the Nation's jobless rate," *Monthly Labor Review*, March 1979, pp. 13–23, and Joseph Antos and others, "What is the current equivalent to unemployment rates of the past?" *Monthly Labor Review*, March 1979, pp. 36–46. Some economists argue that the long-run rate of unemployment will fall because the birth cohorts of the baby boom are now moving into age groups characterized by more stable work experience; in this regard, see Michael L. Wachter, "The Demographic Impact on Unemployment: Past Experience and the Outlook for the Future," in *Demographic Trends and Full Employment* (Washington, National Commission for Manpower Policy, 1976), pp. 27–98. Some of our preliminary analysis tends to lend evidence for the view that the long-run rate may be falling. When business cycle frequencies were eliminated from the national and regional unemployment series, a clearly visible long-run cycle was left that appears to have peaked in most series in 1975.

[7] The spectral decomposition of a series is analogous to an analysis of variance problem. The importance of each component of the series can be assessed in terms of its contribution to the total variance of the series. A measure of the proportion of variance in Ur(f) (fth frequency component of regional series) not accounted for by UR(f) (fth frequency component in national series) is equal to 1-[Var V(f)/Var Ur(f)], where Var V(f) is equal to the variance of the residual component of Ur(f) and Var Ur(f) is equal to the variance of the fth frequency component of regional unemployment.

[8] J. H. McCulloch, "The Monte Carlo Cycle in Business Activity," *Economic Inquiry*, September 1975, pp. 303–21.

[9] This results from an extension of spectral analysis to the bivariate, called cross-spectral analysis. Specifically, a gain statistic (which compares the amplitude of the regional jobless series to that of the national series) is generated and, as such, is similar to a regression slope coefficient.

Occupational deaths declined in 1980, BLS survey finds

Bureau of Labor Statistics survey results show that 4,400 work-connected deaths occurred during 1980 in private sector workplaces employing 11 workers or more.[1] (See table 1.) This was 11 percent less than the 4,950 deaths in 1979. The corresponding fatality rate per 100,000 employees dropped from 8.6 in 1979 to 7.7 in 1980.[2]

Employers participating in the Bureau's Annual Survey of Occupational Injuries and Illnesses were asked to supply specific information about all deaths caused by hazards in the work environment, that is, the object or event most closely associated with the circumstances of the fatality. Fatality percentage estimates by cause have been calculated for both the 1979 and 1980 surveys combined rather than for each year separately, as large sampling errors at the industry division level preclude precise comparisons based on year-to-year changes. Some key survey results:

- Thirty percent of all occupational fatalities were associated with the operation of over-the-road motor vehicles. (See table 2.)

Table 1. Occupational injury and illness fatalities and employment for employers with 11 employees or more by industry, 1979 and 1980

Industry	Annual average employment[1]				Fatalities			
	1979		1980		1979		1980	
	Number (thousands)	Percent	Number (thousands)	Percent	Number	Percent	Number	Percent
Private sector	61,660	100	61,677	100	4,950	100	4,400	100
Agriculture, forestry, and fishing	876	1	943	2	110	2	140	3
Mining	890	1	944	2	490	10	460	10
Construction	3,138	5	3,141	5	960	19	830	19
Manufacturing	20,325	33	19,630	32	1,100	22	1,080	25
Transportation and public utilities	4,637	8	4,665	8	915	19	810	18
Wholesale and retail trade	14,938	24	14,474	23	930	19	580	13
Finance, insurance, and real estate	3,905	6	4,078	7	85	2	150	3
Services	12,951	21	11,802	22	360	7	350	8

[1] Annual average employment for nonagricultural industries is based on the employment and earnings survey conducted by BLS, in cooperation with State agencies. The employment estimate for the services division is adjusted to exclude the nonfarm portion of agricultural services and nonclassifiable establishments. The employment estimates have been adjusted based on County Business Patterns to exclude establishments with fewer than 11 employees. Annual average employment for the agriculture, forestry, and fishing division is a composite of data from State unemployment insurance programs and estimates of hired farmworkers engaged in agricultural production provided by the Department of Agriculture. The agricultural production employment estimate as originally published by the Department of Agriculture is adjusted to exclude employment on farms with fewer than 11 employees.

NOTE: Because of rounding, components may not add to totals.

- Deaths from heart attacks (11 percent) accounted for about 1 of 9 cases.
- Industrial vehicles or equipment were linked to 10 percent of the deaths, and falls accounted for 9 percent.
- The remaining 40 percent of the deaths were largely caused by electrocutions (8 percent), aircraft crashes (5 percent), objects other than vehicles or equipment striking workers (5 percent), or gun shots (4 percent).
- Heart attack cases were concentrated about equally in manufacturing and trade industries at approximately 20 percent of the total. (See table 3.)

Falls continued to take a heavy toll in the construction industry (48 percent of deaths) as do cases where employees are caught in, under, or between objects other than vehicles or equipment (47 percent).

The 4,400 work injury and illness fatalities in 1980 for units with 11 employees or more represent all deaths reported resulting from an occupational injury or illness that occurred in 1980, regardless of the length of time between the injury and death or the length of the illness resulting in death. Of these, about 500 were related to illness.

Slight decreases in employment and fatalities oc-

Table 2. Causes of fatalities resulting from occupational injury and illness in 1979 and 1980[1] in units with 11 employees or more, private sector, by industry, distribution by industry

[In percent]

[5] Less than 1 percent.

NOTE: Because of rounding, percentages may not add to 100.

curred in manufacturing industries during 1979 and 1980. (See table 1). Construction employment remained constant in 1980 at 5 percent of the total as did the percentage of deaths at 19 percent; however, the number of fatalities decreased 14 percent. Another industry which showed a substantial decrease in deaths was wholesale and retail trade, which dropped 38 percent, while employment declined only slightly. Agriculture, forestry, and fishing; mining; and the services industries recorded some increases in employment and relatively minor fluctuations in their proportion of fatalities.

Industry characteristics

The following is a summary by industry of the objects or events associated with fatalities.

Agriculture, forestry, and fishing. Almost half of all deaths in this industry involved vehicles—28 percent highway cars and trucks and 20 percent industrial types of vehicles or equipment such as tractors, logging equipment, and so forth. Heart attacks accounted for 15 percent and the worker being struck by objects, such as falling trees, for 8 percent.

Mining—oil and gas extraction only. Over-the-road and industrial vehicles were traced to more than 2 of 5 deaths in this section of the mining industry. Electrocutions were the cause of 15 percent of the fatalities and heart attacks, for 10 percent.

Construction. Falls continue to be the major cause of death in the construction industry—22 percent of all cases. Vehicles, both highway and industrial, were charged with almost one-third of the deaths; electrocutions accounted for 12 percent, and heart attacks, 9 percent.

Manufacturing. Vehicles (industrial and highway) were blamed for 30 percent of the deaths, and the operation of plant machinery resulted in 12 percent.

Transportation and public utilities. As in past years, highway motor vehicle accidents were connected with close to one-half of all occupational deaths and aircraft, for 11 percent. Heart attacks were responsible for an additional 9 percent, as were electrocutions primarily in the public utilities.

Wholesale and retail trade. Of all deaths caused by gun shot, 7 of 10 were in this industry. However, 48 percent of the deaths were because of car and truck accidents and 14 percent were traceable to heart attacks.

Finance, insurance, and real estate. Over three-fourths of all fatalities in this industry were attributed to motor vehicles (53 percent) and heart attacks (24 percent). Eleven percent were caused by aircraft crashes.

Services. Following the same pattern as other industries, almost one-third of the fatalities that occurred were connected with over-the-road motor vehicles, while heart attacks made up 16 percent. However, 16 percent of deaths in this industry were caused by objects or events not specified in the tables. These come under "all other" causes and include, for example, contact with toxic substances, drowning, and freezing or extreme cold among the many other causes of occupational death.

Background of survey

The Occupational Injuries and Illnesses Survey is a Federal and State program in which reports are received and processed by State agencies participating with BLS. The occupational fatality data reported through the annual survey are based on the records which employers maintain under the Occupational Safety and Health Act of 1970. Excluded from coverage under the act are working conditions which come under other Federal safety and health laws.

The survey covers units in private industries. Excluded are the self-employed; farmers with fewer than 11 employees; private households; and employees in Federal, State, and local government agencies. In a separate reporting system, agencies of the Federal Government are filing reports comparable with those of private industry with the Secretary of Labor.

The 1980 survey, to which a response was mandatory, involved a sample of 220,000 units with 11 employees or more. Estimates based on a sample may differ from figures that would have been obtained had a complete census of establishments been possible using the same schedules and procedures. A relative standard error is calculated for the estimates generated from the Annual Survey of Occupational Injuries and Illnesses. □

FOOTNOTES

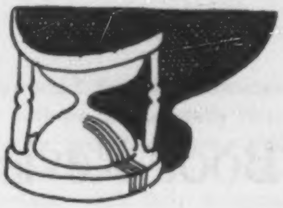
[1] Since 1977, the fatality data have been published only for units with 11 employees or more because the reductions of the survey samples affected primarily employers with fewer than 11 employees. The reductions were in response to Presidential directives on reducing the paperwork burden of employers selected to participate in statistical surveys. Data for occupational fatalities in coal, metal, and nonmetal mining and railroads were provided by the Mine Safety and Health Administration of the U.S. Department of Labor and by the Federal Railroad Administration of the U.S. Department of Transportation; however, data were not provided on the objects or events which resulted in on-the-job deaths for these industrial activities.

[2] The change may be attributed to sampling error.

A note on communications

The *Monthly Labor Review* welcomes communications that supplement, challenge, or expand on research published in its pages. To be considered for publication, communications should be factual and analytical, not polemical in tone. Communications should be addressed to the Editor-in-Chief, *Monthly Labor Review*, Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C. 20212.

Major Agreements Expiring Next Month



This list of collective bargaining agreements expiring in February is based on contracts on file in the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more.

Employer and location	Industry	Union[1]	Number of workers
Anheuser-Busch, Inc. (St. Louis, Mo.)	Food products	Teamsters (Ind.)	1,800
Campbell Soup Co. (Camden, N.J.)	Food products	Food and Commercial Workers	1,300
Central Telephone Co. of Florida	Communication	Electrical Workers (IBEW)	1,050
Cessna Aircraft Co. (Hutchinson, Kans.)	Machinery	Machinists	2,100
Eugene Area Food Agreement (Oregon)[2]	Retail trade	Food and Commercial Workers	1,000
Health Manpower Management, Inc. (Minnesota)	Hospitals	Service Employees	5,000
Kroger Co. (Columbus, Ohio)	Retail trade	Food and Commercial Workers	4,150
Ladish Co. (Cudahy, Wis.)	Primary metals	Machinists	2,000
Marine Towing & Transportation Employers' Association (New Jersey and New York)	Water transportation	Longshoremen's Association	2,000
MTL, Inc. (Honolulu, Hawaii)	Transit	Teamsters (Ind.)	1,200
National Airlines, Inc. (Interstate)[3]	Air Transportation	Transit Union	1,200
Regional Transportation District (Denver, Colo.)	Transit	Transit Union	1,500
Retail Apparel Merchants Association (New York)	Retail trade	Clothing and Textile Workers	2,500
Rockwell International Corp. (Newport Beach, Calif.)	Electrical products	Electrical Workers (IBEW)	1,200
Rockwell International Corp., Collins Radio Group (Dallas, Tex.)	Electrical products	Electrical Workers (IUE)	2,500
Rockwell International Corp., Radio Group (Cedar Rapids, Iowa)	Electrical products	Electrical Workers (IBEW)	5,200
San Diego Gas & Electric Co. (California)	Utilities	Electrical Workers (IBEW)	2,400
Screen Actors Guild 1975 Commercial Contract (Interstate)[2]	Motion pictures	Actors	39,000
Walt Disney Productions Disneyland (Anaheim, Calif.)	Amusements	Service Employees; Food and Commercial Workers; Hotel and Restaurant Employees; Bakery, Confectionary and Tobacco Workers; and Teamsters (Ind.)	1,800
	Government activity	Union or employee organization	
Louisiana Charity Hospital	Hospitals	American Federation of State, County and Municipal Employees	3,000

Frontline report on the Depression

One Third of a Nation: Lorena Hickok Reports on the Great Depression. Edited by Richard Lowitt and Maurine Beasley. Champaign, Ill., University of Illinois Press, 1981. 365 pp. $18.95.

In July 1933, Harry Hopkins, administrator of the Federal Emergency Relief Administration, asked Lorena Hickok to travel the country and report her observations on economic conditions and relief activities. "I don't want statistics from you. I don't want the social-worker angle. I just want your own reaction, as an ordinary citizen . . . . Tell me what you see and hear. All of it," Hopkins said. "Don't ever pull your punches."

For the next year and a half, Hickok crossed the country, writing some 120 reports to Hopkins. Meanwhile, she corresponded almost daily with Eleanor Roosevelt. Richard Lowitt (Iowa State University) and Maurine Beasley (University of Maryland) present some 80 letters to Hopkins and 13 to Roosevelt, all from the Franklin D. Roosevelt Library at Hyde Park, N.Y., which give an extensive, pointed, and moving account of the national situation.

Hickok had climbed to the top of the Associated Press as one of the foremost women reporters, following a precarious childhood. The AP assigned her to cover Eleanor Roosevelt during the 1932 Presidential campaign and she became her confidante and unofficial press adviser. In succeeding years, she traveled with the First Lady through New England and eastern Canada, through the West, and to the Caribbean. Indeed, this friendship had strained her relations with the AP, leading her to resign in June 1933. The editors explain, "No doubt the job [for Hopkins] was arranged through Mrs. Roosevelt."

In her travels, Hickok encountered farm strikers and entered California in the aftermath of the San Francisco General Strike. She witnessed the effects of the wind and cold in the Northern Plains, the drought in the Western Plains, and the heat of California's Imperial Valley. And she wrote dramatically of both the poverty suffered and the dilemmas posed by the large black and Mexican populations in the South and Southwest.

With a keen reporter's eye, she sought the story from several angles, talking with local, State, and Federal officials as well as businessmen, farmers, journalists, and ordinary people from all walks of life—often playing "dumb" to encourage her informants. Then she wrote hard-hitting memos to Hopkins. Of the relief situation in Florida, she said, "It seems to me that I've seen more greed in this State than anywhere else I've been. The whole attitude, both of communities and individuals, seems to be: 'It's Government money! Come on, let's get our share!' "

And she posed a crucial question for all such emergency programs—how to provide enough assistance without eroding confidence and social relations. She quoted a Republican county chairman in Pennsylvania, "What's the use of going back to work if you're worse off than you were before?" In Syracuse, N.Y., she noted that a man with a large family could get $16 a week on relief while the average minimum wage in private industry was $14.

Yet, she wrote of the great privation endured. "'Do you and your husband and the children all sleep in this bed?' the investigator asked. 'We have to,' she replied simply, 'to keep warm.' It was 5 degrees above zero in Bottineau County yesterday."

But she reserved some of her strongest remarks for victims in the broad middle class. For example, she feared the creation of "A whole stranded generation" of workers 40 or 45 or older considered too old for many industries. "Add that whole generation to the list of people who aren't going to get their jobs back because of technological advances, and—well, you've got something."

Yet, she stayed alert to sparks of the human spirit: "They say miners are lazy, but it seems to me you could hardly call a family lazy that would clear and dig up with a pitchfork and spade four acres of land on a mountainside so steep that you could probably not drive a team of horses with a plow up there even if you had them."

Her sympathies definitely lay with the victims—she entitled her own uncompleted attempt to collect and publish her letters, "The Unsung Heroes of the Depression" and dedicated it to the " 'chislers' and the 'shovel-leaners' who have been living on the taxpayers' money." And her observations hit with the impact of Studs Terkel's *Hard Times*, another book which personalizes and humanizes the political histories. Yet, she reaffirms the essential conservatism of most Americans she met. In something of a rebuke to the revisionists, she quotes the president of the Nebraska Farmers' Union: "We're from Missouri. We don't like Mr. Wallace much, but—we're willing to wait awhile and see what happens."

Two major biases or prejudices are evident. In writing of the South and Southwest, Hickok described the poverty—approaching peonage—experienced by blacks and Mexican-Americans, but her primary concern lay with the white or Anglo "white-collar" middle class. Apparently she spent little time with either blacks or Mexicans. On another level, Hickok traveled mostly through rural areas, and most of her comments emphasized agricultural problems. Although she visited New York, Philadelphia, and other large cities, her observations focused on the immediate need for housing, food, and work. She apparently made little effort to talk to many industrial workers or to the more radical labor organizers.

Hickok's assignment, after all, was to report on economic conditions and the effectiveness of various relief programs. She accomplished this in excellent fashion, providing perceptive personal, administrative, and sociological comment. These reports provide graphic descriptions of the country before the "safety nets" were raised and of the difficulties encountered in erecting them. They are especially pertinent reading at a time when the country is reassessing the role of government developed during the Depression, for they tell it all—the good and the gruesome, the greed and the grace.

The future of work

Working in the Twenty-First Century. Edited by C. Stewart Sheppard and Donald C. Carroll. New York, Philip Morris, Inc., 1980. 235 pp., bibliography. $18.95, John Wiley and Sons, New York.

Because work is the primary connection to life for most persons, this collection of thoughtful essays is an attempt to project what life will be like in the coming century. This book focuses on likely patterns of personal value changes, the effects of these on domestic, economic, and social institutions, and how the amalgam of all can be affected by the emerging trends in global, political, and economic activities.

The Business schools of the Universities of Pennsylvania and Virginia cosponsored a symposium to analyze the future. Fifteen knowledgeable persons from business, labor, and the sciences, both social and technical, were invited to present papers which form the substance of this excellent book. The authors are generally optimistic but they don't evade the projected threats and pitfalls even though the dangers pointed to are sometimes contradictory in accordance with their doctrinal beliefs.

In considering individual values, Suzanne Keller, from a university, enlarges on a theme by Kenneth Boulding, who sees us moving from a "cowboy economy"—reckless, violent and romantic—where incremental production and consumption become almost ends in themselves, to a "spaceship economy" in which production and consumption have value only in relation to protecting people and resources. She maintains that while most people can accommodate the idea of technological change, they are less comfortable with changes in social institutions and customs. Another academician, James O'Toole, sees today's growing erosion of responsibility as a trend which must be shifted to secure a safe passage into the next century. A pervasive march toward cradle to grave entitlements, not only among the unionized work force, but also in the managerial ranks, has sapped, he says, the long-run health of the U.S. economy. He gleans some hope for increasing our acceptance of responsibility in recent northern plant closings where groups of middle-managers and workers have taken over under austere conditions to attempt a rescue of jobs and output.

A spate of authors has raised questions about the new technology. How will it help our society, how will it impinge on the worker, what does it portend for the national ecology? One author says that biosciences and advanced information handling will continue our shift from the industrial to the post-industrial society, bringing many improvements in life and the need for a highly sophisticated work force. William Lucy of the American Federation of State, County and Municipal Employees (AFSCME) points to the preponderance of jobs in services over manufacturing and indicates a continuation of that trend, which, he avers, means a growing group of less skilled, alienated workers in lower-paying jobs, in which any one person is easily replaced. Further, he states that antiunionism is on the rise. Highly sophisticated consultants are placed in establishments to foment clever obstructions where union development might arise. There is also intensive lobbying against prolabor legislation in the Congress.

Theodore Kheel believes, nevertheless, that collective bargaining will be with us during the 21st century, and, if we maintain our system of free enterprise, basic negotiations on conditions of employment will be little changed. He says that unionization in the private sector will remain at about the same level as now, public sector unionization may continue its growth for a while, mergers of unions will continue for more economical operations, and their political lobbying will continue to grow in seeking favorable labor legislation. The Machinists' William Winpisinger sees unions influencing corporate decisions by the use of pension fund payments and, alarmed by the growth of multinational companies, predicts that initial attempts will be made to settle industrial relations disputes on a global basis.

Jerome Rosow discusses a University of Michigan survey which indicates a steady decline in worker satisfaction, and states that this "cannot be isolated from the steady decline in the Nation's productivity growth rate." He says that to correct this problem in the future, alternative work patterns like flexitime, part-time shared jobs, and increased worker participation in decisions that affect their jobs will require increasing attention.

James Jordon, an industrial vice president for labor relations, believes that, in the future, plant layoffs will be an obsolete way of controlling variable costs. Given a year or more of training per worker, who in some plants control millions of dollars in capital equipment, new ways to assure job security will become a management goal. On balance, however, he cannot see any sudden future shifts that will greatly change the present status of either management or unions. Ian Wilson, a General Electric consultant, in one of the very few references to poverty in the book, assumes that there will be fewer people in poverty in the coming century because over the past five generations—since 1800—per capita income has doubled each 30 odd years, and despite some possible slowing will likely continue to grow. This increasing affluence will bring greater education, a labor force with more subtle methods at its command for seeking its new values and demands, and an increased emphasis on social, ego, and self-fulfillment needs.

George Vojta, a Citibank vice president, is one of several spokesmen identifying the growing debate on whether future life and work should be based on notions of efficiency or equality. He is a reasoned proponent of free enterprise, which he believes can more efficiently use national resources than can government enterprise because in Schumpeter's terms private enterprise, under pressure to survive, is more likely to destroy old systems and replace with new, while government dominated enterprise, not undergoing similar pressures, often goes the way of Britain, Italy, or the Communist nations. In contrast to William Lucy, Vojta maintains that service jobs will be outpaced by skilled professional, technical, and managerial job growth, and that while the individual productivity of these skilled workers will not markedly increase, the new technology they will direct will yield increasing productivity and opportunity in the service sector.

Only at the risk of its own domestic and international stability can the United States ignore the needs of the developing countries, says Cecilio Morales, an officer of the Inter-American Development Bank. He identifies the gap between industrial and developing countries in the fact that the industrial countries now have almost the entire world stock of infrastructure, technical know-how, and scientific research capacity. At the same time, high levels of unemployment and poverty in the Third World foster local political instabilities and subsequent international peril points. In the new century, he naturally sees the need for increasing developmental lending, but more important, and even more painful to the United States and Europe, he foresees the need to shift many of their soft-goods industries to those developing nations that offer more natural advantages.

This modest volume is a first-rate repository of seminal ideas for those in business, government, or labor who have the will and courage to look ahead to the next 100 years. All will not agree with these previsions of life and work, but few will lightly cast aside these thoughts.

Want to get ahead? Consider your generation

Birth and Fortune: The Impact of Numbers on Personal Welfare. By Richard A. Easterlin. New York, Basic Books, Inc., 1980. 205 pp. $11.95.

Is the American malaise identified by former President Carter a temporary blemish or a permanent scar? Economist Richard A. Easterlin believes it is temporary, the result of 1950's baby-boom children desperately competing for good jobs, career promotions, housing, and living space. The national mood will change when the 1970's baby-bust generation comes of age after 1985.

Birth and Fortune is the best-written introduction to the theory that population changes affect and are affected by our sense of economic well-being. After World War II, "government policies stabilizing demand and capping immigration set the stage for the leading role that generation size today plays in determining a cohort's economic welfare." Your cohort or generation now determines, *inter alia,* your economic future; your chances of marrying, having children, and staying married; and your vulnerability to psychological stress and mental illness. Although "other important influences" are also at work, a "baby-boom generation finds the going comparatively tough. Correspondingly, a baby-bust generation will find life relatively easy."

The book is divided into four parts. The first two chapters summarize the argument and the second three discuss the implications of demographic waves on the family. Part three outlines the economic effects of population changes and the final two chapters contain predictions.

Demographic wave theory argues that the relative *size* of your generation (or cohort) blesses or burdens you throughout your lifetime. In the United States, the lucky was born during the 1930's. Its children are the unlucky ones born in the 1950's. The "baby-bust" of the 1960's and 1970's will make life easy for the youth of the 1980's and 1990's, but the 1980's baby boom expected because of these good times will increase competition again after 2005. And so it goes. Every 20 years, a new lucky or unlucky generation comes of age.

Generation size shows up in decisions to marry and have children. A couple's economic prospects depend on their potential earnings and their material aspirations. Because "people generally find mates from within the same economic class," Easterlin approximates earnings potential by comparing the actual income of a young man to his parents' income. As the young man's income rises relative to his parents' income, he (and other young adults) "will feel less economic pressure and hence freer to marry and have children." Using crude approximations, Easterlin finds, not surprisingly, rising relative incomes for young men during the 1946 to 1957 baby boom and declining relative incomes to explain the baby bust since (except for the 1965–69 Vietnam-era boom).

But what about the effects of the pill and women's liberation? Easterlin's not too convincing explanation asserts: "that traditional sex-role attitudes predominate in the population," that improved contraception techniques primarily permit young couples to respond faster to changing economic pressures; and that women still hold largely "female" jobs. Thus, "traditional sex roles will persist." Contraception and liberation only accentuate trends dictated by economics.

Easterlin believes that the social forces reshaping American life *reinforce* more important generation-size effects. The discussion of divorce is illustrative. The "typical" male finds his success linked to his work. "The woman's sense of personal fullfillment . . . in contrast, depends much more on her sense as a parent than as a worker." Couples from large and small generations "retain the same notions about their respective roles," but marital strains and divorce are more common in a large generation.

Large generations do more than break up families and reduce levels of social well-being. They also aggravate inflation, the final nail in the picture that "creates a general feeling of deterioration in society."

How do large generations contribute to stagflation? Easterlin believes that employers hire older experienced workers and younger workers in fixed proportions. When experienced workers are available, employers can hire both old and young and increase production. But large generations lead to a labor market mismatch that impairs traditional Keynesian demand management. When experienced workers are not available, employers stop adding new plants and machines because the employer "cannot staff it with young, inexperienced workers."

Large generations increase the natural or noninflationary unemployment rate in three ways. First, young persons traditionally have higher unemployment rates because searching for a first or new job takes longer without experience. As the youth share of the total work force rises, the unemployment rate creeps up because the "age composition" has changed. There is also a second, reinforcing "age-specific" effect. Because youth and older persons are hired from separate labor queues, more youth increases competition for available jobs and raises the youth unemployment rate. Third, the labor-market problems of young men encourage young women to seek jobs, further increasing competition and raising the youth and total unemployment rate. It is estimated that these labor force changes have added "about 1.5 percentage points" to the noninflationary unemployment rate since 1960.

What does our demographic future hold? Easterlin sees "American society as possibly subject to waves of good times and bad." Declining birth rates (1940–60) make life easy and encourage baby booms. Competition increases when baby booms enter the work force (1960–80), discouraging births. But the baby-bust generation that comes of age between 1980 and 2000 can look forward to "the good news . . . that things will get better." Good times, especially in the 1990's, will prompt another baby boom that will once again increase competition and provoke bad times after 2000. The United States is driven by 20-year fertility cycles, more important than the politicians that will alternately claim and disclaim responsibility for them.

Demographic wave theory argues that the typical couple's outlook depends on its earnings prospects relative to past actual earnings of parents. The all-important male spouse's earnings prospects depend on the share of inexperienced youth workers in the total labor force. This youth share is a result of fertility decisions made 20 years earlier.

Is Easterlin's study of *one* baby boom and bust cycle from 1940 to 1980 really indicative of the future? Easterlin reasserts his belief in the persistence of traditional sex roles, the simple youth share analysis and basic American optimism. However, attitude and structural changes may mute the coming baby boom. But

Easterlin still believes that the baby boom and bust of the last 40 years show that "American life is now subject to a sizable self-generating cycle in economic and social conditions."

Is Easterlin correct to say that the theory will remain valid even if parts of it turn out to be wrong? I believe Easterlin underestimates the social and labor market effects of 1970's insecurities and attitude changes. More important, he draws too sharp a distinction between pre- and post-1940 developments. For example, the 800,000 legal immigrants and refugees admitted to the United States in 1980 are as many as were admitted during the peak 1900–14 immigration waves. To these legal immigrants must be added an unknown number of illegal immigrants—perhaps 300,000 to 500,000 annually. Thus, immigration alone could maintain population growth rates and discourage the expected baby boom.

Some observers look to the 1985 labor force entrance of baby-bust youth with trepidation. They argue that the American economy is ill-prepared to adjust to the labor force shrinkage necessary to spur Easterlin's baby boom. Many want temporary alien workers—guestworkers—to smooth out labor force growth. If the United States obeys these guestworker advocates, it may kill the incentive that would automatically correct this labor force swing.

Current Labor Statistics

Notes on Current Labor Statistics 62

Schedule of release dates for major BLS statistical series 62

Employment data from household survey. Definitions and notes 63
1. Employment status of noninstitutional population, selected years, 1950-80 63
2. Employment status by sex, age, and race, seasonally adjusted 64
3. Selected employment indicators, seasonally adjusted 65
4. Selected unemployment indicators, seasonally adjusted 66
5. Unemployment rates, by sex and age, seasonally adjusted 67
6. Unemployed persons, by reason for unemployment, seasonally adjusted 67
7. Duration of unemployment, seasonally adjusted 67

Employment, hours, and earnings data from establishment surveys. Definitions and notes 68
8. Employment by industry, 1951-80 69
9. Employment by State 69
10. Employment by industry division and major manufacturing group 70
11. Employment by industry division and major manufacturing group, seasonally adjusted 71
12. Labor turnover rates in manufacturing, 1977 to date 72
13. Labor turnover rates in manufacturing, by major industry group 72
14. Hours and earnings, by industry division, 1950-80 73
15. Weekly hours, by industry division and major manufacturing group 74
16. Weekly hours, by industry division and major manufacturing group, seasonally adjusted 75
17. Hourly earnings, by industry division and major manufacturing group 76
18. Hourly Earnings Index, by industry division, seasonally adjusted 76
19. Weekly earnings, by industry division and major manufacturing group 77
20. Gross and spendable weekly earnings, in current and 1967 dollars, 1961 to date 78

Unemployment insurance data. Definitions 79
21. Unemployment insurance and employment service operations 79

Price data. Definitions and notes 80
22. Consumer Price Index, 1967-80 81
23. Consumer Price Index, U.S. city average, general summary and selected items 81
24. Consumer Price Index, cross classification of region and population size class 87
25. Consumer Price Index, selected areas 88
26. Producer Price Indexes, by stage of processing 89
27. Producer Price Indexes, by commodity groupings 90
28. Producer Price Indexes, for special commodity groupings 92
29. Producer Price Indexes, by durability of product 92
30. Producer Price Indexes for the output of selected SIC industries 92

Productivity data. Definitions and notes 95
31. Annual indexes of productivity, hourly compensation, unit costs, and prices, selected years, 1950-80 95
32. Annual changes in productivity, hourly compensation, unit costs, and prices, 1970-80 96
33. Quarterly indexes of productivity, hourly compensation, unit costs, and prices, seasonally adjusted 96
34. Percent change from preceding quarter and year in productivity, hourly compensation, unit costs, and prices .. 97

Labor-management data. Definitions 98
35. Wage and benefit settlements in major collective bargaining units, 1976 to date 98
36. Effective wage rate adjustments going into effect in major collective bargaining units, 1976 to date 99
37. Work stoppages, 1947 to date 99

NOTES ON CURRENT LABOR STATISTICS

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics. A brief introduction to each group of tables provides definitions, notes on the data, sources, and other material usually found in footnotes.

Readers who need additional information are invited to consult the BLS regional offices listed on the inside front cover of this issue of the *Review*. Some general notes applicable to several series are given below.

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might otherwise mask short-term movements of the statistical series. Tables containing these data are identified as "seasonally adjusted." Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years.

Seasonally adjusted labor force data in tables 2–7 were revised in the February 1981 issue of the *Review* to reflect the preceding year's experience. Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X-11/ARIMA, which was developed at Statistics Canada as an extension of the standard X-11 method. A detailed description of the procedure appears in *The X-11 ARIMA Seasonal Adjustment Method* by Estela Bee Dagum (Statistics Canada Catalogue No. 12-564E, February 1980). The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. Revisions of historical data continue to be made only at the end of each calendar year.

Annual revision of the seasonally adjusted payroll data in tables 11, 13, 16, and 18 begins with the August 1980 issue using the X-11 ARIMA seasonal adjustment methodology. New seasonal factors for productivity data in tables 33 and 34 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The resulting values are described as "real," "constant," or "1967" dollars.

Availability of information. Data that supplement the tables in this section are published by the Bureau of Labor Statistics in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule given below. The *BLS Handbook of Labor Statistics*, Bulletin 2070, provides more detailed data and greater historical coverage for most of the statistical series presented in the *Monthly Labor Review*. More information from the household and establishment surveys is provided in *Employment and Earnings*, a monthly publication of the Bureau, and in two comprehensive data books issued annually—*Employment and Earnings, United States* and *Employment and Earnings, States and Areas*. More detailed information on wages and other aspects of collective bargaining appears in the monthly periodical, *Current Wage Developments*. More detailed price information is published each month in the periodicals, the *CPI Detailed Report* and *Producer Prices and Price Indexes*.

Symbols

p = preliminary. To improve the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.

r = revised. Generally this revision reflects the availability of later data but may also reflect other adjustments.

n.e.c. = not elsewhere classified.

Schedule of release dates for major BLS statistical series

Series	Release date	Period covered	Release date	Period covered	MLR table number
Employment situation	January 8	December	February 5	January	1-11
Producer Price Index	January 12	December	February 12	January	26-30
Consumer Price Index	January 22	December	February 25	January	22-25
Real earnings	January 22	December	February 25	January	14-20
Labor turnover in manufacturing	January 27	December	...	...	12-13
Productivity and costs:					
Nonfarm business and manufacturing	January 28	4th quarter	...	...	31-34
Work stoppages	January 29	December	February 26	January	37
Major collective bargaining settlements	January 29	1981	...	...	35-36

NOTE: Because of budget reductions in the Bureau of Labor Statistics, the labor turnover series will be discontinued effective with the release of December 1981 data in January 1982.

EMPLOYMENT DATA FROM THE HOUSEHOLD SURVEY

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 60,000 households beginning in May 1981, selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons are (1) those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population; the **total labor force** includes military personnel. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons retired, those engaged in their own housework, those not working while attending school, those unable to work because of long-term illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy.

Full-time workers are those employed at least 35 hours a week; **part-time workers** are those who work fewer hours. Workers on part-time schedules for economic reasons (such as slack work, terminating or starting a job during the week, material shortages, or inability to find full-time work) are among those counted as being on full-time status, under the assumption that they would be working full time if conditions permitted. The survey classifies unemployed persons in full-time or part-time status by their reported preferences for full-time or part-time work.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data presented in table 1. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings*.

Data in tables 2–7 are seasonally adjusted, based on the seasonal experience through December 1980.

1. Employment status of the noninstitutional population, 16 years and over, selected years, 1950–80

[Numbers in thousands]

Year	Total noninstitutional population	Total labor force		Civilian labor force						Not in labor force

EMPLOYMENT, HOURS, AND EARNINGS DATA FROM ESTABLISHMENT SURVEYS

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by 166,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

LABOR TURNOVER DATA in this section are compiled from personnel records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies. A sample of 40,000 establishments represents all industries in the manufacturing and mining sectors of the economy.

Definitions

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 14–20 include production workers in manufacturing and mining; construction workers in construction; and nonsupervisory workers in transportation and public utilities, in wholesale and retail trade, in finance, insurance, and real estate, and in services industries. These groups account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to eliminate the effects of price change. The **Hourly Earnings Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries. **Spendable earnings** are earnings from which estimated social security and Federal income taxes have been deducted. The Bureau of Labor Statistics computes spendable earnings from gross weekly earnings for only two illustrative cases: (1) a worker with no dependents and (2) a married worker with three dependents.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

Labor turnover is the movement of all wage and salary workers from one employment status to another. **Accession rates** indicate the average number of persons added to a payroll in a given period per 100 employees; **separation rates** indicate the average number dropped from a payroll per 100 employees. Although month-to-month changes in employment can be calculated from the labor turnover data, the results are not comparable with employment data from the employment and payroll survey. The labor turnover survey measures changes during the calendar month while the employment and payroll survey measures changes from midmonth to midmonth.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of June 1981 data, published in the August 1981 issue of the *Review*. Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Complete comparable historical unadjusted and seasonally adjusted data are published in a Supplement to Employment and Earnings (unadjusted data from April 1977 through March 1981 and seasonally adjusted data from January 1974 through March 1981) and in *Employment and Earnings, United States, 1909–78*, BLS Bulletin 1312–11 (for prior periods).

Data on recalls were shown for the first time in tables 12 and 13 in the January 1978 issue of the *Review*. For a detailed discussion of the recalls series, along with historical data, see "New Series on Recalls from the Labor Turnover Survey," *Employment and Earnings*, December 1977, pp. 10–19.

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20. See also *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976).

The formulas used to construct the spendable average weekly earnings series reflect the latest provisions of the Federal income tax and social security tax laws. For the spendable average weekly earnings formulas for the years 1979–81, see *Employment and Earnings*, March 1981, pp. 10–11. Real earnings data are adjusted using the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W).

NOTE: The industry divisions of mining; construction; tobacco manufactures (a major manufacturing group, nondurable goods); transportation and public utilities; and finance, insurance, and real estate are no longer shown. This is because the seasonal component in these is small relative to the trend-cycle, or irregular components, or both, and consequently cannot be precisely separated.

17. Hourly earnings, by industry division and major manufacturing group

[Gross averages, production or nonsupervisory workers on private nonagricultural payrolls]

NOTE: The earnings expressed in 1977 dollars have been adjusted for changes in price level as measured by the Bureau's Consumer Price Index for Urban Wage Earners and Clerical Workers. These series are described in "The Spendable Earnings Series: A Technical Note on its Calculation," **Employment and Earnings and Monthly Report on the Labor Force**, February 1969, pp. 6-13. See also "Spendable Earnings Formulas, 1979-81," **Employment and Earnings**, March 1981, pp. 10-11.

UNEMPLOYMENT INSURANCE DATA

NATIONAL UNEMPLOYMENT INSURANCE DATA are compiled monthly by the Employment and Training Administration of the U.S. Department of Labor from monthly records of unemployment insurance activity prepared by State agencies. Railroad unemployment insurance data are prepared by the U.S. Railroad Retirement Board.

Definitions

Data for **all programs** represent an unduplicated count of insured unemployment under State programs, Unemployment Compensation for Ex-Servicemen, and Unemployment Compensation for Federal Employees, and the Railroad Insurance Act.

Under both State and Federal unemployment insurance programs for civilian employees, insured workers must report the completion of at least 1 week of unemployment before they are defined as unemployed. Persons not covered by unemployment insurance (about 10 percent of the labor force) and those who have exhausted or not yet earned benefit rights are excluded from the scope of the survey. **Initial claims** are notices filed by persons in unemployment insurance programs to indicate they are out of work and wish to begin receiving compensation. A claimant who continued to be unemployed a full week is then counted in the insured unemployment figure. The **rate of insured unemployment** expresses the number of insured unemployed as a percent of the average insured employment in a 12-month period.

An **application** for benefits is filed by a railroad worker at the beginning of his first period of unemployment in a benefit year; no application is required for subsequent periods in the same year. **Number of payments** are payments made in 14-day registration periods. The **average amount of benefit payment** is an average for all compensable periods, not adjusted for recovery of overpayments or settlement of underpayments. However, **total benefits** paid have been adjusted.

21. Unemployment insurance and employment service operations

[All items except average benefits amounts are in thousands]

[1] Initial claims and State insured unemployment include data under the program for Puerto Rican sugarcane workers.

[2] Includes interstate claims for the Virgin Islands. Excludes transition claims under State programs.

[3] Excludes data on claims and payments made jointly with other programs.

[4] Includes the Virgin islands. Excludes data on claims and payments made jointly with State programs.

[5] Cumulative total for fiscal year (October 1-September 30). Data computed quarterly.

NOTE: Data for Puerto Rico included. Dashes indicate data not available.

r = revised.

PRICE DATA

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Definitions

The **Consumer Price Index** is a monthly statistical measure of the average change in prices in a fixed market basket of goods and services. Effective with the January 1978 index, the Bureau of Labor Statistics began publishing CPI's for two groups of the population. One index, a new CPI for All Urban Consumers, covers 80 percent of the total noninstitutional population; and the other index, a revised CPI for Urban Wage Earners and Clerical Workers, covers about half the new index population. The All Urban Consumers index includes, in addition to wage earners and clerical workers, professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctor's and dentist's fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. Prices are collected from over 18,000 tenants, 24,000 retail establishments, and 18,000 housing units for property taxes in 85 urban areas across the country. All taxes directly associated with the purchase and use of items are included in the index. Because the CPI's are based on the expenditures of two population groups in 1972–73, they may not accurately reflect the experience of individual families and single persons with different buying habits.

Though the CPI is often called the "Cost-of-Living Index," it measures only price change, which is just one of several important factors affecting living costs. Area indexes do not measure differences in the level of prices among cities. They only measure the average change in prices for each area since the base period.

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes contains about 2,800 commodities and about 10,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (that is, finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings.

Price indexes for the output of selected SIC industries measure average price changes in commodities produced by particular industries, as defined in the *Standard Industrial Classification Manual 1972* (Washington, U.S. Office of Management and Budget, 1972). These indexes are derived from several price series, combined to match the economic activity of the specified industry and weighted by the value of shipments in the industry. They use data from comprehensive industrial censuses conducted by the U.S. Bureau of the Census and the U.S. Department of Agriculture.

Notes on the data

Beginning with the May 1978 issue of the *Review*, regional CPI's cross classified by population size, were introduced. These indexes will enable users in local areas for which an index is not published to get a better approximation of the CPI for their area by using the appropriate population size class measure for their region. The cross-classified indexes will be published bimonthly. (See table 24.)

For further details about the new and the revised indexes and a comparison of various aspects of these indexes with the old unrevised CPI, see *Facts About the Revised Consumer Price Index*, a pamphlet in the Consumer Price Index Revision 1978 series. See also *The Consumer Price Index: Concepts and Content Over the Years*, Report 517, revised edition (Bureau of Labor Statistics, May 1978).

For interarea comparisons of living costs at three hypothetical standards of living, see the family budget data published in the *Handbook of Labor Statistics, 1977*, Bulletin 1966 (Bureau of Labor Statistics, 1977), tables 122–133. Additional data and analysis on price changes are provided in the *CPI Detailed Report* and *Producer Prices and Price Indexes*, both monthly publications of the Bureau.

As of January 1976, the Wholesale Price Index (as it was then called) incorporated a revised weighting structure reflecting 1972 values of shipments. From January 1967 through December 1975, 1963 values of shipments were used as weights.

For a discussion of the general method of computing consumer, producer, and industry price indexes, see *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), chapters 13–15. See also John F. Early, "Improving the measurement of producer price change," *Monthly Labor Review*, April 1978, pp. 7–15. For industry prices, see also Bennett R. Moss, "Industry and Sector Price Indexes," *Monthly Labor Review*, August 1965, pp. 974–82.

[1] Data for July 1981 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[2] Not available.

[3] Prices for natural gas are lagged 1 month.

[4] Includes only domestic production.

[5] Most prices for refined petroleum products are lagged 1 month.

[6] Some prices for industrial chemicals are lagged 1 month.

r = revised.

28. Producer Price Indexes, for special commodity groupings

PRODUCTIVITY DATA

PRODUCTIVITY DATA are compiled by the Bureau of Labor Statistics from establishment data and from estimates of compensation and output supplied by the U.S. Department of Commerce and the Federal Reserve Board.

Definitions

Output is the constant dollar gross domestic product produced in a given period. Indexes of **output per hour of labor input,** or labor productivity, measure the value of goods and services produced per hour of labor. **Compensation per hour** includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. The data also include an estimate of wages, salaries, and supplementary payments for the self-employed, except for nonfinancial corporations, in which there are no self-employed. **Real compensation per hour** is compensation per hour adjusted by the Consumer Price Index for All Urban Consumers.

Unit labor cost measures the labor compensation cost required to produce one unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current dollar gross domestic product and dividing by output. In these tables, **unit nonlabor costs** contain all the components of unit nonlabor payments except unit profits. **Unit profits** include corporate profits and inventory valuation adjustments per unit of output.

The **implicit price deflator** is derived by dividing the current dollar estimate of gross product by the constant dollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

The use of the term "man hours" to identify the labor component of productivity and costs, in tables 31 through 34, has been discontinued. **Hours of all persons** is now used to describe the labor input of payroll workers, self-employed persons, and unpaid family workers. **Output per all-employee hour** is now used to describe labor productivity in nonfinancial corporations where there are no self-employed.

Notes on the data

In the private business sector and the nonfarm business sector, the basis for the output measure employed in the computation of output per hour is Gross Domestic Product rather than Gross National Product. Computation of hours includes estimates of nonfarm and farm proprietor hours.

Output data are supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics.

Beginning with the September 1976 issue of the *Review*, tables 31–34 were revised to reflect changeover to the new series—private business sector and nonfarm business sector—which differ from the previously published total private economy and nonfarm sector in that output imputed for owner-occupied dwellings and the household and institutions sectors, as well as the statistical discrepancy, are omitted. For a detailed explanation, see J. R. Norsworthy and L. J. Fulco, "New sector definitions for productivity series," *Monthly Labor Review*, October 1976, pages 40–42.

LABOR-MANAGEMENT DATA

MAJOR COLLECTIVE BARGAINING DATA are obtained from contracts on file at the Bureau of Labor Statistics, direct contact with the parties, and from secondary sources. Additional detail is published in *Current Wage Developments*, a monthly periodical of the Bureau. Data on work stoppages are based on confidential responses to questionnaires mailed by the Bureau of Labor Statistics to parties involved in work stoppages. Stoppages initially come to the attention of the Bureau from reports of Federal and State mediation agencies, newspapers, and union and industry publications.

Definitions

Data on wage changes apply to private nonfarm industry agreements covering 1,000 workers or more. Data on wage and benefit changes *combined* apply only to those agreements covering 5,000 workers or more. **First-year wage settlements** refer to pay changes going into effect within the first 12 months after the effective date of the agreement. **Changes over the life of the agreement** refer to total agreed upon settlements (exclusive of potential cost-of-living escalator adjustments) expressed at an average annual rate. **Wage-rate changes** are expressed as a percent of straight-time hourly earnings, while **wage and benefit changes** are expressed as a percent of total compensation.

Effective wage-rate adjustments going into effect in major bargaining units measure changes actually placed into effect during the reference period, whether the result of a newly negotiated increase, a deferred increase negotiated in an earlier year, or as a result of a cost-of-living escalator adjustment. Average adjustments are affected by workers receiving no adjustment, as well as by those receiving increases or decreases.

Work stoppages include all known strikes or lockouts involving six workers or more and lasting a full shift or longer. Data cover all workers idle one shift or more in establishments directly involved in a stoppage. They do not measure the indirect or secondary effect on other establishments whose employees are idle owing to material or service shortages.

35. Wage and benefit settlements in major collective bargaining units, 1976 to date

How to order BLS publications

PERIODICALS

Order from (and make checks payable to) Superintendent of Documents, Washington, D.C. 20402. For foreign subscriptions, add 25 percent.

Monthly Labor Review. The oldest and most authoritative government research journal in economics and the social sciences. Current statistics, analysis, developments in industrial relations, court decisions, book reviews. $23 a year, single copy $3.50.

Employment and Earnings. A comprehensive monthly report on employment, hours, earnings, and labor turnover by industry, area, occupation, et cetera. $31 a year, single copy $3.75.

Occupational Outlook Quarterly. A popular periodical designed to help high school students and guidance counselors assess career opportunities. $8 for four issues, single copy $2.75.

Current Wage Developments. A monthly report about collective bargaining settlements and unilateral management decisions about wages and benefits; statistical summaries. $14 a year, single copy $2.50.

Producer Prices and Price Indexes. A comprehensive monthly report on price movements of both farm and industrial commodities, by industry and stage of processing. $20 a year, single copy $3.50.

CPI Detailed Report. A monthly periodical featuring detailed data and charts on the Consumer Price Index. $20 a year, single copy $3.50.

PRESS RELEASES

The Bureau's statistical series are made available to news media through press releases issued in Washington. Many of the releases also are available to the public upon request. Write: Bureau of Labor Statistics, Washington, D.C. 20212.

Regional. Each of the Bureau's eight regional offices publishes reports and press releases dealing with regional data. Single copies available free from the issuing regional office.

BULLETINS AND HANDBOOKS

About 140 bulletins and handbooks published each year are for sale by regional offices of the Bureau of Labor Statistics (see inside front cover) and by the Superintendent of Documents, Washington, D.C. 20402. Orders can be charged to a deposit account number–or checks can be made payable to the Superintendent of Documents. Visa and MasterCard are also accepted; include card number and expiration date. Among the bulletins and handbooks currently in print:

Occupational Outlook Handbook, 1980–81 Edition. Bulletin 2075. A useful resource supplying valuable assistance to all persons seeking satisfying and productive employment. $9, paperback; $12, cloth cover.

Employment Trends in Computer Occupations. Bulletin 2101, October 1981. Results of a BLS study of employment of workers in five computer-related occupations. $3.50.

Handbook of Methods. Bulletin 1910. Brief technical account of each major statistical program of the Bureau of Labor Statistics. $5.50.

Occupational Projections and Training Data. Bulletin 2052. Presents both general and detailed information on the relationship between occupational requirements and training needs. (Updates Bulletin 2020.) $5.50.

Exploring Careers. Bulletin 2001. A new career guidance resource designed for junior high school students but useful for older students as well. Includes occupational narratives, evaluative questions, suggested activities, career games, and photographs. $11.

Profile of the Teenage Worker. Bulletin 2039. Focuses on the labor market experience of 16- to 19-year-olds. Based on data from the Current Population Survey, the bulletin reviews past trends and explores the problems of youth unemployment and the transition from school to work. $3.75.

Profiles of Occupational Pay: A Chartbook. Bulletin 2037. A graphic illustration of some of the factors that affect workers' earnings. This three-part presentation looks at wage variations among and within occupations and portrays characteristics of high- and low-paying urban areas and manufacturing industries. $4.00.

Perspectives on Working Women: A Databook. Bulletin 2080. Presents comprehensive statistics on characteristics of working women. Topics covered in 100 tables and brief text include extent of work experience, marital and family status, education, earnings, occupations, and race and Hispanic ethnicity. (Updates Bulletin 1977.) $5.00.

Productivity Measures for Selected Industries, 1954–79. Bulletin 2093. Indexes of output per employee-hour and output per employee for 96 industries are presented in charts and tables. (Updates Bulletin 2054.) $7.50.

REPORTS AND PAMPHLETS

Single copies available free from the BLS regional offices or from the Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C. 20212.

Major Programs of the Bureau of Labor Statistics. Report 552. A summary of the Bureau's principal programs, including data available, sources, uses, and publications.

Employment in Perspective: Working Women. A quarterly report series presenting highlights of current data on women in the labor force.

Employment in Perspective: Minority Workers. A quarterly report series presenting highlights of current data on blacks and persons of Hispanic origin in the labor force.

Wage Surveys

for the Following Industries:

Industry Wage Survey: Appliance Repair, November 1978
Industry Wage Survey: Meat Products, May 1979
Industry Wage Survey: Millwork, June 1979
Industry Wage Survey: Wood Household Furniture, June 1979

- **Appliance Repair**
- **Meat Products**
- **Millwork**
- **Wood Household Furniture**

Surveys include:

- Results from the latest BLS survey of wages and supplemental benefits.
- Detailed occupational data for the nation, regions, and selected areas (where available).
- Data useful for wage and salary administration, union contract negotiation, arbitration, and Government policy considerations.

Labor Month In Review

STATE OF THE ART. Annual meetings of the American Economic Association often are occasions for self-examination. Two University of Wisconsin economists contributed to that tradition at the recent Washington, D.C., meeting of the Association with critical looks at the state of the art of economics.

Jack Barbash, John P. Bascom Professor of Economics and Industrial Relations (emeritus), warned that academic economics is turning into a guild because its craft or professional side is promoted at the expense of its practical or problem-solving side. Here are excerpts from his paper, "The Guilds of Academe or Brother, Can You Paradigm?"

What makes academic economics a guild form is the primacy of producer values over consumer values—research over teaching, theory over application, fidelity "to guild rules [over] quick adaptation to popular demand." It is not that the practical uses of economics are ignored by the guild; it is that guild priorities are shaped by inner-directed craft interests which overshadow, perhaps even overwhelm, the externally oriented uses of economics in the real world.

There is a respectable body of commentary, ironically by guild members of impeccable standing, which assails guild economics on two fundamental grounds: (1) irrelevance to the real world and (2) hyperrefinement of methodology. These are classic guild pathologies. Innovation and problem-solving in the real world of economics seem to be mainly the work of businessmen, popularizers and politicians who are typically objects of fear and loathing within guild circles and whose approaches to problem-solving are put down by guildpersons as "adversary bargaining" or "political dialogue."

The guild principle has actually served academic economics well. Economics is probably the most demanding of the social sciences and has attracted many of the first-rate minds in the country. The guild rigor has made economics the "hardest" of the social sciences.

Problem-solving, on the other hand, has not, I think, been well served by guild values in academic economics. Not a single vital issue of our time—poverty, labor unrest, unemployment, urban deterioration, discrimination, economic development (perhaps inflation is a perverse exception)—has been brought to public awareness through the scholarship of mainstream economics. Once, however, partisans, politicians and popularizers bring the issue out into the open, academic economists do not shrink from processing it for its value to the guild paradigm.

The loss of relevance and accessibility in economics carries large implications for the politics of a democracy. It means that large masses of citizens are rendered powerless to cope with problems in the household and the public economies except through mediation by a meritocracy. No evil intentions are implied. But guild narcissism relegates civic education to an inferior position in its scheme of values. The complexity of large-scale society makes economics difficult enough. But guild obscurantism makes the discipline even more complex and abstruse to the layman than it needs to be.

John M. Culbertson, professor of economics, suggested that economics may be failing because it has never made the transition to the thought-world of modern science. Here are excerpts from his paper, "Economics and the Scientific Method."

Over the past two centuries, one field of thought after another has basically recreated itself by adopting the scientific method and discarding its earlier methods and its earlier doctrines, which were revealed by the new intellectual standards as myths, wishful beliefs, prejudices, superstitions. Where does economics fit into this picture?

The factions into which economists are divided and their versions of economics obviously derive from political or ideological preconceptions. Indeed, the major versions of economics all seem to tell different versions of the same basic story, which is the elemental story of prophetic myth: Everything would be just fine, just as it should be, if only. . .—here one fills in one's version of the required simple, symbolic action, the panacea, laissez faire, deregulation, supply side, or public ownership of the means of production, the required slogan, Keynesian Revolution, monetarism, radical economics. Can this be science?

In the prevailing economics, one hears a great deal of "relations," but, strangely, virtually nothing of the distinction between causal relations and what once were "spurious correlation." One hears much of "significance," but this proves to be "statistical significance"—a statistical significance properly contingent on conditions that usually prove not to be met. One hears little of knowledge, much of theories, models, hypotheses, conjectures, propensities, principles. One sees endless speculations relating to hypothetical cases, but virtually no reference to the actual structures and processes by which events are governed in actual economies.

The present condition of economics can be interpreted as implying the existence of a great challenge to economists. Economics now could be something very different from what it is. Economics could be providing the means to deal realistically with societal economic problems, rather than providing a stream of ideological nostrums and fashionable gimmicks, to mislead economic policy. □

Tracking youth joblessness: persistent or fleeting?

High turnover, seasonality, and work-school transitions are some reasons for high unemployment among young people; a recent longitudinal study suggests that recurrent and extensive joblessness among a relatively few persons may also be an important aspect of the labor market

NORMAN BOWERS

Many studies have focused on differences between youth and adults in job and labor force turnover in attempts to account for the fact that youth unemployment is always higher than that of adults. However, some recent research suggests that the observed age-related differences in the incidence of joblessness are misleading indicators of the dynamics of youth unemployment. While frequent turnover is admittedly a feature of the youth labor market, the core of joblessness may in fact be accounted for by a relatively small number of persons who search for jobs for very long periods.[1]

A new study of matched data from the Current Population Survey examines the unemployment experience of selected individuals in the course of a year, and over 2 consecutive years. The findings suggest that:

- Prolonged joblessness is somewhat concentrated among a relatively small group of workers but is also strongly affected by the business cycle.
- A clear association exists between the extent of past joblessness and the likelihood of subsequent unemployment.
- Two or more spells of joblessness in one year do not necessarily presage similar unemployment the next year.
- Recurrent unemployment is no respecter of age, striking all labor force groups.

The analysis exploits the short-run longitudinal capabilities of the Current Population Survey, which permit construction of a 2-year retrospective labor force history of persons in the sample. This previously untapped data set allows some examination of the following important questions: Is the experience of extensive unemployment in one year associated with extensive unemployment in the following year? How important are repeat spells of unemployment? And, are persons with multiple spells of unemployment in one year more likely than others to experience spells in the subsequent year?

Of course, 2 years is a relatively short time in terms of labor force history, and no definitive analysis of what has been called the "scarring effect" of persistent youth joblessness is possible.[2] Still, the questions that can be addressed are of interest in their own right.

Data sets and limitations

The Current Population Survey (CPS), which provides the underlying data base for the following analysis, is a monthly survey of a rotating panel of approximately 60,000 households (strictly speaking, addresses).[3] Each month, Census Bureau enumerators visit the households in the sample and ask a series of structured questions about the labor force status of each member 16 years of age and over during the reference week. The CPS com-

---

Norman Bowers is an economist in the Office of Current Employment Analysis, Bureau of Labor Statistics.

prises eight independent panel or rotation groups. Each household is interviewed for 4 consecutive months, dropped from the sample for 8 months, and reinterviewed for 4 final months. Therefore, it is possible that as many as one-half of the households visited in March of one year will be interviewed again the following March, and that responses for this subset of the CPS sample may be matched for purposes of longitudinal study.[4]

To examine work and unemployment experience, two separate matches were made from CPS data for March 1975–76, and for March 1978–79. These reference dates were chosen for two basic reasons: First, every March, a series of supplemental questions about the previous year's work experience is asked of CPS respondents. Included is such information as weeks worked, weeks unemployed, spells of unemployment, and number of employers worked for during the previous year. Thus, for those persons in our matched samples, we have 2 years of labor force history; that is, the work experience data in the matched files refer to 1974–75 and 1977–78. This allows some examination of the concentration and persistence of unemployment, the effects of repeated jobless spells, and so forth. Second, the data from these two time periods might shed some light on the effect of the business cycle on work experience; the March 1975–76 match covers a rather deep recessionary period, while the March 1978–79 match covers 2 years of recovery and expansion.

Several important restrictions on the use of these data and the sample should be noted at the outset. The major data problem is that the work experience questions are asked retrospectively, and the responses are thus subject to recall biases. Respondents may not accurately remember what they and the other members of their households were doing a year earlier. For example, individuals may not recall a brief period during which they were not available for work, and may instead report one long spell of unemployment. The results of Census Bureau tests with the usual monthly CPS questions suggest that recall bias is very important, and generally results in higher estimates of employment and lower estimates of unemployment.[5]

In addition to the data limitations, there are problems with the matched sample, in particular those involving differing probabilities of reinterview and response variability. Basically, the biases in the matched data fall under the heading of sample selectivity:[6] All movers, nonrespondents, those who died, and persons who change answers to questions on which the match is keyed (such as race or sex) are lost to the sample. (In contrast to most longitudinal files, the CPS is not designed to follow respondents who move.) This problem goes beyond the simple loss of a match because the reason for a non-match may, in some way, be correlated with an individual's labor force activity. For example, persons who change addresses or are otherwise not matched may have different patterns of labor force activity than others. In other words, it is possible that there is some interaction between labor market activity and the likelihood of being in the matched file.

Thus, our matched sample is not a random sample of the population, and common forms of statistical analysis are not necessarily appropriate without adjustment for the selectivity problem. For example, persons who change addresses are disproportionately "lost" from the sample, while those less likely to move—older people and whites—are overrepresented in both of the matched data sets. More importantly, only about 50 percent of youth age 18 to 24 who were potential matches were retained. More than 60 percent of 16- and 17-year-olds made the match, but that is still somewhat below the proportion of adults matched. In addition, persons in the actual match are less likely than those in the full set of potential matches to have been currently unemployed, and slightly more likely to have been currently employed (especially in March 1975–76). If current labor force status is associated with past status, or is a determinant of future work experience, the matched data will necessarily reflect that bias.

A related sample problem involves rotation group bias. Persons in rotation groups 1 through 4 in March 1975 and March 1978 were eligible for inclusion in each match.[7] The data for whites age 18 and over indicate that these persons are underrepresented in the first rotation group relative to each of the other rotation groups. On the other hand, there is some evidence of an overrepresentation of blacks age 16 to 17 in the first rotation group. (Interpreting the data for the other age groups for blacks in the sample is difficult, as the rotation group proportions fluctuate considerably.) Of course, individuals do not necessarily enter the survey in the first rotation group, because the rotation group identifier refers to the address of the household and not to the person(s) occupying the address. And, the matched sample may be weighted toward later rotation panels if persons in later rotation groups are more likely to be matched because they are less "mobile"—the sample selectivity problem.

The phenomenon of rotation group bias in panel surveys can often involve more than just differential reinterview probabilities. Specifically, it may also include a conditioning effect—that is, the answers to survey questions are affected by the number of times the respondent has been interviewed. However, the degree to which the information from the CPS work experience questionnaire might be influenced by respondent conditioning is not known.

Lastly, there is the problem of weighting the data. Because the weights used to inflate the raw sample counts from each monthly CPS are based on answers received that month, the March weights for the match periods 1975–76 and 1978–79 need not be the same. As there is currently no reliable theoretical or statistical foundation for handling this problem, the unweighted matched samples are used for analysis. Therefore, any results based on these data pertain, strictly speaking, only to those persons in the sample, and generalized conclusions should be significantly tempered.[8]

A theoretical overview

The unemployment rate may be disaggregated into its frequency and extent components. Much previous research has indicated that youth-adult differences are primarily the result of a higher incidence of unemployment among youth, rather than longer spells.[9]

Table 1 provides further evidence of this relationship. The incidence of unemployment shown is simply the number of persons who experienced unemployment at any time over the period divided by the number of persons with any labor force experience during the period. Both the incidence over a single year and that for the 2-year period covered by the matched data have been calculated.[10] (Excluded from the unemployment figures are all persons who worked at least 50 weeks during the year, but also experienced a 1- to 2-week temporary layoff. This exclusion should not greatly affect the estimates for youth because so few are full-year workers. The calculations for adults 25 years of age and older will be biased downward slightly because a number do experience such brief layoffs.) Table 1 also shows the probability that those in the sample who reported unemployment in 1974 or 1977 also experienced some joblessness during the subsequent year (1975 or 1978). This probability is a rough indicator of the "persistence" of unemployment. The closer the probability is to 1, the less "turnover" there is among those who experience unemployment. Last, we show the average number of weeks of joblessness experienced over the entire 2-year period covered by each match. This number was estimated by dividing the total number of weeks of unemployment over the match period by the number of persons who had some unemployment at any time during that 2 years.

Not surprisingly, the results are similar to the findings of other researchers. The likelihood of joblessness declines with increasing age, while average total time unemployed increases with age. Blacks have a higher incidence of joblessness, and usually spend more time unemployed than whites. Youth whose major activity was attending school show both a lower incidence and spend significantly less total time unemployed than other youth.[11]

The probability that persons who had some unemployment in 1974 or 1977 also experienced unemployment during the following year varied among demographic groups. Youth age 18 to 24 were generally more likely than others to have some joblessness in both years, but these differences were not always large. Overall, the results suggest that neither the persistence hypothesis—that the same persons unemployed one year are also unemployed the next year—nor the turnover hypothesis—that different persons are unemployed each year—completely fits the facts.

Information on weeks of employment is shown in table 2. Reported weeks worked vary significantly by age, race, sex, and major activity.[12] And, except for those whose major activity was school, the average number of weeks worked varies in the opposite manner from that of the experience of unemployment.[13] Lastly, the probability that persons who worked during 1974 or 1977 also worked during the following year varied significantly among groups. For example, young blacks were much less likely than their white counterparts to have worked in consecutive years.

Recently, some researchers have suggested that youth-adult experiences cannot be fully explained by these simple average differences in the likelihood and amount of unemployment and the "normal turnover" that such movement is supposed to represent.[14] Specifically, it has been suggested that the "youth job problem" is really one of a small minority of persons who are without jobs for extended periods, rather than the outcome of high job turnover, seasonality, and the transition between school and work. Do the CPS match data lend any evidence for this hypothesis?

Recurrent unemployment

Repeat spells. It is certainly true that analysis of "average durations" and "average flow probabilities" may mask differences in the experience of unemployment within demographic groups. For example, while the probability of unemployment may satisfactorily account for most youth-adult differences, the bulk of youth joblessness may be highly concentrated by race, sex, or major activity or the same persons may experience many (short) spells of unemployment over time. (Of course, such concentration may also occur within other labor force groups.) Thus, an important question is: Do the same persons experience multiple spells of unemployment from year to year, or is there little relationship between past and subsequent spell frequencies?

Data on the prevalence of repeated jobless spells are available from the CPS matched file. But the information is subject to one additional important limitation. In the March work-experience supplement to the CPS, one of the questions is: "Were the (number of) weeks (person's name) was looking for work (or on layoff) all in one stretch?" The responses are coded as 1 spell, 2 spells, or 3 or more spells. *However, this question is asked only of* *those persons who also worked at any time during the previous year.* Thus, spell information is obtained only for a subset of those who experienced some unemployment. Because demographic groups differ significantly in the likelihood of having worked during the year, the data may be biased in terms of assessing the issue of recurrent spells of unemployment. Consider, for example, the data set for the 1977–78 match. In 1977, blacks, women, and persons whose major activity was school were less likely to have worked than other groups. However, a number of such individuals were reported as having looked for work for varying lengths of time, and were thus unemployed labor force participants. (The results from the 1974–75 match, although not shown here, were very much the same. The major difference was that, regardless of their experience in 1974, there was a somewhat greater likelihood that persons reported one or more spells in 1975 than was true of the 1977–78 match. This is clearly a cyclical phenomenon.)

There are a number of ways to examine the importance of multiple periods of unemployment.[15] For example, one might calculate the average number of spells per person, and compare that across demographic

Table 1. The incidence and duration of unemployment by age, race, sex, and school status, 1974–75 and 1977–78

[1] The incidence of unemployment in a single year is the number of persons who experienced some unemployment divided by the number with some labor force experience.

[2] The incidence of unemployment over the full 2-year period refers to the number of persons who were unemployed at least once divided by the number of persons who were in the labor force at least once during the 2 years.

[3] The average duration was calculated as total weeks unemployed during the 2-year period divided by the number of persons who experienced unemployment at least once. Total weeks unemployed was derived by multiplying the number of persons unemployed by the mid-point of the following duration intervals: 1 to 4 weeks; 5 to 14 weeks; 15 to 26 weeks; 27 to 39 weeks; and 40 to 52 weeks.

NOTE: Excludes those persons who worked at least 50 weeks during the year and experienced a temporary layoff of 1 to 2 weeks.

Table 2. Duration of employment by age, race, sex, and school status, 1974–75 and 1977–78

[In weeks]

Age, race, sex, and school status	1974–75: Average duration of employment, 1974	1974–75: Average duration of employment, 1975	1974–75: Average duration of employment, 1974–75	1974–75: Probability of some employment in both 1974 and 1975	1977–78: Average duration of employment, 1977	1977–78: Average duration of employment, 1978	1977–78: Average duration of employment, 1977–78	1977–78: Probability of some employment in both 1977 and 1978

groups; or, one might estimate the proportion of the unemployed who had more than one spell over a given period. The approach taken here is a bit different, in that it attempts to determine whether individuals who report multiple spells in one period are more likely than those with one or no reported spells to experience multiple spells in the next period.

The information needed to address this question is presented in tables 3 and 4. These tables show the number of persons in the sample by the number of jobless spells reported in 1977 and the corresponding probability of having no spells reported, one spell, two spells, or more than two spells during 1978.[16] For example, table 3 shows that among 16- to 17-year-olds who had one spell in 1977, 20 percent had one spell in 1978. It is important to note that persons shown in the "no spells reported" category include both those who had no unemployment, and those with some unemployment but no work experience. Depending on the labor force group, the "no work-unemployment" group constituted 2 to 9 percent of the total "no spells reported" category.

The data in table 3 suggest several interesting phenomena. First, for all persons there is a somewhat higher probability that those who had multiple spells in 1977 experienced at least one spell in 1978. Second, the likelihood of experiencing two or more spells in 1978 tends to be an increasing function of the number of spells in 1977 (except among all 18- to 19-year-olds). Unfortunately, the reasons for the transitions from employment into unemployment cannot be determined. And, in order to identify any causal relation between multiple spells in one period and the experience of multiple spells in the subsequent period, we would require more information to ensure that the results are not simply due to heterogeneity in the probability of recurrent spells among individuals. Of equal importance is the fact that there is far from a perfect correlation between reported spells in 1977 and the likelihood of spell recurrence in 1978, and, as previously indicated, 2 years of data may be insufficient to truly assess the issue of spell recurrence. It may be noted that youth age 16 to 24 who had two or more spells in 1977 were somewhat more likely than their adult counterparts to report two or more spells in 1978; this was especially true for persons age 20 to 24.

Men with multiple jobless spells in 1977 were more likely than women to have multiple spells in 1978, and this difference in probabilities tends to increase with age. However, regardless of sex and age, the probability of two or more spells in 1978 is positively related to the number of spells in 1977.[17]

Table 4 shows the experience of persons 16 to 24 years of age by their major activity classification in March 1978. Persons 16 to 19 whose major activity was school were less likely to report having any spells in 1978 (recall that this does not necessarily mean they had no unemployment), regardless of the number of spells in 1977. There is no clear difference in this probability among 20- to 24-year-olds. Individuals age 16 to 19 whose major activity was other than school and who experienced two or more jobless spells in 1977 were just slightly more prone to report multiple spells again in 1978 compared to the school group. However, this difference was not very large.

The data in tables 3 and 4 do indicate some correlation between repeat spells in 1977 and spells in 1978, but the significance of this relationship is unclear. Differences in the probability of recurrent spells between youth and adults are not large, but the fact that one must have had some work experience in 1977 in order to be asked about jobless spells may introduce a significant bias to this comparison. Thus, while there is some support for the hypothesis that "past turnover is associated with subsequent turnover," the phenomenon does not appear to be pervasive, or to differ greatly among labor force groups.[18]

The concentration of unemployment. Perhaps recurrent, multiple spells of unemployment mask the fundamental nature of youth and other groups' joblessness. Instead, it may be that unemployment is truly concentrated

among persons who suffer very long single spells of unemployment, while most others are unemployed only infrequently or not unemployed at all. To address this question, it is necessary to examine the extent to which the total number of weeks unemployed during a given period is "concentrated" among a small number of people.[19]

Little information is available on this issue, primarily because of the difficulties in obtaining unemployment (and employment) spell histories. The usual approach has been to use data from the March CPS work-experience supplement to measure the extent of unemployment over the previous year. From these data it is possible to calculate the number of weeks of joblessness by duration category as a percent of total reported weeks unemployed for any given labor force group. For example, in 1975, only 4.4 percent of all persons with some labor force experience were unemployed for more than 26 weeks, but this group accounted for almost 52 percent of total weeks unemployed.[20]

The same kind of information by age, sex, race, and major activity is shown in tables 5, 6, and 7 for the years 1974–75, and 1977–78. Again, the data are from the matched CPS files. The calculations are based on the mid-range of the unemployment duration categories. This is a rather simplistic assumption, but it should not affect the relative value of the estimates because it is used consistently. The analysis excludes essentially year-round workers with 1 to 2 weeks unemployment due to temporary layoff, but all other persons who looked for work are included.

As previous research has indicated, the aggregate probability of leaving unemployment tends to decline with time unemployed. The result is an apparent concentration of unemployment in longer duration categories simply because the likelihood of escape from joblessness is lower the longer a spell has lasted. Even if each individual's escape rate were constant over time unemployed, a relatively large share of unemployment would be accounted for by individuals with lower escape probabilities. The data should be interpreted with this in mind.

As expected, the yearly data in table 5 provide clear evidence of over-the-year unemployment concentration, but the degree of concentration varies somewhat by age, sex, and economic conditions. In 1974, the 8.6 percent of the labor force of young men age 16 to 17 who were unemployed more than 14 weeks accounted for 69.3 percent of total weeks unemployed. (The labor force percentages are not shown here, but are available upon request.) Among women of the same age, the numbers were 4.1 and 53.6 percent, respectively. The brief bouts that youth have with unemployment would appear to contribute less to overall unemployment; among 16- to 17-year-old males in 1974, 14.6 percent were jobless less than 5 weeks and accounted for just 12.8 percent of all weeks unemployed. There is a pronounced cyclical pattern to these data. In 1975, both the proportion of the labor force and the percent of total weeks unemployed indicate a sizable shift toward extensive individual total weeks of unemployment. The 1977 and 1978 distributions tend to fall between those for 1974 and 1975.[21]

Table 6 shows similar information by race. With the exception of 16- to 17-year-olds in 1974, both the percent of total weeks unemployed over 14 weeks and the proportion of the labor force jobless for that length of time are higher for black workers. And, once again, cyclical factors clearly operate to lengthen total time out of work: In 1975, fully 23 percent of the labor force of blacks age 18 to 19 were unemployed more than 14 weeks, accounting for 82.7 pecent of total weeks unemployed. For white workers, the figures were 10.5 and 76.7 percent, respectively.

The distributions vary only slightly by major activity (table 7), except among those age 16 to 17, for whom no pattern is apparent. For those 18 to 19 whose major activity was not school, unemployment was more concentrated in long total durations relative to the major activity school group, irrespective of aggregate economic conditions. With the exception of 1977, this was also true among 20- to 24-year-olds.

The data tell a consistent story. Weeks unemployed over the course of a year are highly concentrated and very sensitive to the business cycle. Although the degree of concentration among adults is somewhat more skewed toward longer total time unemployed than among youth, the difference is not very large. However, relating this concentration to the issue of "turnover" depends, in part, on whether lengthy unemployment occurs in one spell or is spread over many spells. Our data show that some persons are unemployed a lot, but this does not necessarily mean that these individuals spend a long time finding a particular job. The observed inequality in the distribution of unemployment could also result if all unemployment were generated by high turnover. Any determination of the importance of turnover requires estimating (simulating) how unequal unemployment would be in a simple economy with high turnover and comparing the results to the observed concentrations.[22]

The following tabulation tries to put this issue into some perspective. The first eight lines indicate the proportion of persons unemployed 15 weeks or longer—generally considered the floor for long-term unemployment—in the indicated year and who also worked, by the number of spells of unemployment reported. (Only data for 1974 and 1977 are shown here, but the results for 1975 and 1978 were similar.) For example, among 16- to 17-year-olds in 1977, 44.4 percent of those with unemployment over 14 weeks reported it all in one spell. (The last two lines of the tabulation show the percentage of people unemployed over 14 weeks who did not work at any time during the indicated year and for whom there is thus no spell information available.)

	Age			
	16 to 17	*18 to 19*	*20 to 24*	*25 and over*
1974:				
Persons with work experience	100.0	100.0	100.0	100.0

The results are interesting, in part because of the differences between years. In 1977, teenagers who worked and who experienced extensive unemployment were more likely than persons over age 20 to have been jobless two or more times; in addition, a larger fraction of teenagers than of others did not work at all and experienced more than 14 weeks of unemployment. On the other hand, the data for 1974 show little difference in spell proportions except for 18- to 19-year-olds. For example, among 16- to 17-year-olds who worked in 1974, 48.6 percent of those with at least 15 total weeks of unemployment had two or more spells compared to 51.3 percent for adults 25 years of age and older. The proportion with no work experience was little different between adults and 16- to 17-year-olds, although a much smaller percentage of those age 18 to 24 reported no work experience. While a sizable proportion of long duration unemployment is accounted for by persons who had no work experience during the year, the data do suggest that it is hazardous to conclude that a large majority of workers with a lot of unemployment incur it in one long spell.

It is very useful to know that, in a single year, joblessness is concentrated among a small proportion of the labor force who are unemployed a lot, although not necessarily in a single spell. However, it is quite another matter to infer that the same individuals experience persistent, lengthy periods of unemployment year after year. In the next section, we use CPS data to gain some additional perspective on this issue.

Table 7. Percent distribution of unemployment by duration, school status, and age, selected years, 1974–78

Year and duration of unemployment	Major activity: School			Major activity: Other		
	16 to 17 years	18 to 19 years	20 to 24 years	16 to 17 years	18 to 19 years	20 to 24 years

40 to 52 weeks	26.4	29.6	24.1	25.3	19.6	22.1

Is current status linked with past unemployment?

If the observed concentration of unemployment is more than a statistical anomaly in information for single years, one would expect data from the 2-year CPS matched samples to corroborate the following two hypotheses: First, the more weeks an individual is unemployed in one year, the higher is his or her probabilit of experiencing some unemployment the subsequen year. Second, a worker with extensive unemployment

Table 8. Weeks of unemployment in 1974 and 1977 and the probability of experiencing unemployment during the subsequent year, by sex, race, and age

one year is more likely to encounter the same prospect the next year.

Tables 8 and 9 provide information relevant to these hypotheses.[23] They show the probability that persons had at least 1 week or more than 14 weeks of joblessness in 1975 or 1978 by the length of time unemployed during the previous year (1974 or 1977). For example, table 8 shows that, for those age 16 to 17 who were unemployed 1 to 4 weeks in 1974, the probability of having at least 1 week of unemployment in 1975 was .316.

With virtually no exception, persons unemployed longer in one year have a higher probability of having some joblessness during the next year. Moreover, long-term unemployment (a total of 15 weeks or more) during one year is associated with a higher probability of extensive total joblessness during the subsequent year. There appear to be some age-related differences in these probabilities, but they are not so large or persistent that they show up in each data set. However, this unemployment persistence does seem to be slightly greater among those age 18 to 24 than among adults or young teenagers. There is also a cyclical pattern in the unemployment probabilities; that is, regardless of time unemployed during 1974, individuals had a higher probability of 15 weeks or more of joblessness in 1975 than during the recovery-expansion years of 1977–78. Once again, this underscores the critical importance of the business cycle in understanding unemployment duration.

Blacks and whites exhibit the same general pattern as all workers in these age categories. However, except among 16- to 17-year-old employed blacks (for whom

Table 9. Weeks of unemployment in 1974 and 1977 and the probability of experiencing unemployment during the subsequent year, by school status and age

the very small sample makes data interpretation hazardous), blacks unemployed in 1974 or 1977 were somewhat more likely than whites to experience unemployment in 1975 or 1978. And blacks who were jobless at least 15 weeks in either 1974 or 1977 had a somewhat higher probability than whites of experiencing extensive unemployment during the subsequent year.

Table 9 shows that 18- to 24-year-olds whose major activity was not school, and who had more than 14 weeks of unemployment in 1974 or 1977, were only marginally more likely than their student counterparts to experience long periods of unemployment in the following year. For example, 30.6 percent of those age 20 to 24 whose major activity was other than school and who were unemployed more than 14 weeks in 1977 had long-term unemployment in 1978, compared to 27.3 percent among the school group. However, these differences are related, at least in part, to the business cycle; the differences in probabilities are much greater for 1974–75 than for 1977–78.

The foregoing analysis does suggest that unemployment is concentrated, in the sense that there is an association between past and subsequent unemployment over a 2-year period for the persons in this sample. However, determination of a strict causal relationship, or of influences, other than the business cycle, on the labor supply and demand schedules underlying the association is beyond the scope of this study.[24] Nor have we advanced any hypothesis about what constitutes a substantively significant degree of persistence. These are subjects for further research.[25] □

FOOTNOTES

ACKNOWLEDGEMENT: This article is part of a longer report presented at the Experts Meeting on the Role of High Turnover in Youth Labor Markets sponsored by the Organization for Economic Co-Operation and Development, Paris, Nov. 27–28, 1980. The comments received from participants at the Experts Meeting, particularly John M. Evans and John P. Martin, were extremely helpful in clarifying many issues. The author would also like to express his appreciation to Bernard Altschuler, Kenneth Buckley, John Lawrence, and Bob Whitmore of the Bureau of Labor Statistics for their assistance in the preparation of this article.

[1] A critique of much of the relevant literature is contained in Norman Bowers, "Young and marginal: an overview of youth employment," *Monthly Labor Review*, October 1979, pp. 4-16. A turnover perspective and an implicit critique of that approach can be found in Jacob Mincer and Linda Leighton, "Labor Turnover and Youth Unemployment," and Kim Clark and Lawrence Summers, "The Dynamics of Youth Unemployment," in Richard Freeman and David Wise, eds., *The Youth Unemployment Problem: Its Nature, Causes, and Consequences* (Chicago, University of Chicago Press, 1981). Also see Joseph Antos and Wesley Mellow, "The Youth Labor Market: A Dynamic Overview," BLS Staff Paper 11 (Bureau of Labor Statistics, 1979).

[2] For example, this article will not discuss the potential impact of unemployment on subsequent wages (and growth in wages) or career prospects. See Brian E. Becker and Stephen M. Hills, "Teenage Unemployment: Some Evidence of the Long Run Effects on Wages," *Journal of Human Resources*, Summer 1980, pp. 354–72; David Ellwood, "Teenage Unemployment: Permanent Scars or Temporary Blemishes," in Richard Freeman and David Wise, eds., *The Youth Unemployment Problem: Its Nature, Causes, and Consequences* (Chicago, University of Chicago Press, 1981); and Paul Osterman, *Getting Started: The Youth Labor Market* (Cambridge, Mass., MIT Press, 1980).

Also see Dale Morgenstern and Nancy Barrett, "The Retrospective Bias in Unemployment Reporting by Sex, Race and Age," *Journal of the American Statistical Association*, June 1974, pp. 355–57.

[6] See James Heckman, "Sample Selection Bias as a Specification Error," Working Paper No. 172 (Cambridge, Mass., National Bureau of Economic Research, 1977), pp. 1–55; and G. S. Maddala, "Self-Selectivity Problems in Econometric Models," in P. Krishniah, ed., *Applications of Statistics* (Amsterdam, North Holland Publishing Co., 1977). An example of selectivity bias from CPS matched data is included in Francis W. Horvath, "Tracking individual earnings mobility with the Current Population Survey," *Monthly Labor Review*, May 1980, pp. 43–46.

[7] See Barbara Bailar, "The Effects of Rotation Group Bias on Estimates from Panel Surveys," *Journal of the American Statistical Association*, March 1975, pp. 23–30; Barbara Bailar and Camilla Brooks, "An Error Profile: Employment as Measured by the Current Population Survey," report prepared for the Federal Committee on Statistical Methodology, Subcommittee on Nonsampling Errors, 1978; and Philip McCarthy, "Some Sources of Error in Labor Force Estimates from the Current Population Survey," Background Paper 15 (National Commission on Employment and Unemployment Statistics, 1978), pp. 62–76.

[8] The data supporting these assertions are available from the author upon request.

[9] See George Perry, "Unemployment Flows in the U.S. Labor Market," *Brookings Papers on Economic Activity, 2*, 1972, pp. 245–78; Jacob Mincer and Linda Leighton, "Labor Turnover and Youth Unemployment"; and Robert Frank and Richard Freeman, "The Distribution of the Unemployment Burden: Do the Last Hired Leave First?" *Review of Economics and Statistics*, August 1978, pp. 380–91. Note that our concern is with differences across groups. Discussion of the concentration and persistence of unemployment within groups will be analyzed later in the article. The age breaks used for this study were chosen to allow for some examination of differences between adults and various youth groups. For example, those age 16 to 17 tend to be in school; school activity drops off considerably with age. Therefore, one might expect different labor force experience between (say) 16- to 17-year-olds and those age 20 to 24 who are more likely to be in the process of establishing themselves in the full-time labor market. It is also important to understand how age was defined in this paper. From the March 1975-March 1976 matched file, individuals were classified on the basis of their age as of March 1975. From the March 1978-March 1979 file the age classification related to March 1978. Therefore, we are not comparing the behavior of 16- to 17-year-olds in 1974 with the behavior of 16- to 17-year-olds in 1975. Rather, we are following the same individuals over the entire 2-year time span for which data are available from each matched file, but to simplify the tabular presentation, age is taken as fixed as of March 1975 or March 1978.

[10] The incidence of unemployment over the 2-year period is less than twice the average incidence because some people experienced unemployment during both years. There are two possible reasons for this: First, the experience of unemployment in one year increases the probability of having some unemployment the next year. And, second, individuals may have constant (over time) but different probabilities of becoming unemployed, and those with higher probabilities are more likely to be jobless at any time. For a discussion of "sorting" and "tenure dependence," see Stephen W. Salant, "Search Theory and Duration Data: A Theory of Sorts," *Quarterly Journal of Economics*, February 1977, pp. 39–57; A. McGregor, "Unemployment Duration and Re-employment Probability," *Economic Journal*, December 1978, pp. 693–706; and John Barron and Wesley Mellow, "Changes in Labor Force Status Among the Unemployed," *Journal of Human Resources*, Summer 1981, pp. 427–41.

[11] It is important to understand the meaning of the "major activity" classification. The very first item posed to the household respondent for each young person in the CPS sample is: "What was (person's name) doing most of last week, going to school or something else?" This is not the same as asking whether the individuals were enrolled or not enrolled in school. For example, there will be persons who are enrolled in school whose major activity is something else. If this group is "more committed" to the labor force, measures of labor force experience by major activity will tend to show more volatility among the school group. Further, the classification refers to specific months —March 1975 and March 1978—and not, as is true of the employment and unemployment data, to an entire year. Changes in one's major activity could have occurred in the months between March 1975–76 and between March 1978–79. Any differences exhibited between major activity status cannot necessarily be taken as an indication of a causal relation.

[12] There is some evidence from the CPS that the proportion of black male youth with any employment experience in a given year has fallen significantly. No discernible trend is evident for whites. See Norman Bowers, "Young and Marginal," p. 9.

[13] Differences in the unemployment and employment experience of the major activity groups have suggested to some analysts that one's "student status" is an important explanatory variable for many young persons' partial commitment to the job market. Whether school activity is a cause, effect, or involves reciprocal interaction, however, is open to some dispute. Much more about the school-work relation, the role of youth labor in the economy, and changes in that role over time, as well as the functions of the educational system and its connection to the economy would first have to be specified before any causal statement could be made with confidence. See Robert Lerman, "Some Determinants of Youth School Activity," *Journal of Human Resources*, Summer 1972, pp. 366–83; and Paul Osterman, "Understanding Youth Unemployment," *Working Papers for a New Society*, January–February 1978, pp. 58–63.

[14] This view is particularly associated with the work of Kim Clark and Lawrence Summers, "The Dynamics of Youth Unemployment."

[15] An analysis of recurrent spells among three age cohorts in Great Britain may be found in Richard Disney, "Recurrent Spells and the Concentration of Unemployment in Great Britain," *Economic Journal*, March 1979, pp. 109–19.

[16] The small cell sizes in many cases make interpretation of the probability calculations very difficult. Therefore, rather than a finely detailed dissection of the data, focus will be on a few general features.

[17] Black-white differences—not shown here—exhibited no detectable pattern, a fact perhaps affected by the sample selectivity involved; that is, although blacks reported more unemployment than whites, they were less likely to have had any work experience during 1977 and therefore spell information was not collected.

[18] We also examined whether there was an association between the reporting of multiple spells and an individual's industry of longest job during the previous year. Especially among adults, the percent with two or more spells whose industry of longest job was in construction was quite a bit higher than the proportions in other major industries. This association also held—though not as strongly—for those age 20 to 24. Not surprisingly, those teenagers with multiple spells were not disproportionately concentrated in any industry. Note, however, that "industry of longest job" in the past year is not necessarily the only industry in which individuals worked over the year, nor does it necessarily indicate working for the same employer.

[19] See Kim Clark and Lawrence Summers, "The Dynamics." Robert Frank and Richard Freeman, in "The Distribution of the Unemployment Burden," also make the point that spell length may be more important in explaining differences in unemployment within the youth group than differential turnover or spell frequency.

[20] See Norman Bowers, "Probing the issues of unemployment duration," *Monthly Labor Review*, July 1980, p. 30.

[21] Among adults who had some work experience, those whose longest job over a given year was in construction were more likely than others to experience 15 or more weeks of unemployment. This association was much weaker among teenagers. As would also be expected, the proportion of workers with more than 14 weeks of unemployment in a year tended to be greater across all major industry groups in 1975 than in other years. Again, this represents the importance of the business cycle in understanding length of time spent looking for work.

[22] See Robert Lerman, "The Nature of the Youth Employment Problem: A Review Paper," prepared for the Vice President's Task Force on Youth Employment, Nov. 26, 1979, pp. 28–29.

[23] Data in these tables do not necessarily show causality because of the problem of distinguishing heterogeneity and state dependence. One attempt to test for heterogeneity or duration dependence among a sample of unemployed workers is discussed in A. McGregor, "Unemployment Duration," pp. 693–706. One might buttress the results shown in the tables with regression analysis. However, simply correlating current with previous unemployment does not necessarily isolate the impact of previous unemployment if some people—because of institutional and personal characteristics—are more prone to experience unemployment; and, such characteristics need not be observable. In part, this issue revolves around the questions of "adjusting or controlling" for heterogeneity among individuals in the likelihood of experiencing unemployment, and sample selection bias. Of course, a number of ways have been proposed to handle this problem, but their adequacy rests heavily upon the existence of a well-specified theory of unemployment and the "goodness of fit" in transforming the theoretical concepts into their testable empirical counterparts, and, equally important, having a correct theory of censored samples in order to adjust for selectivity bias, assuming that one believes the issue to be important to understanding unemployment. Because of the much fuller treatment that these questions deserve, no attempt was made to go beyond the tabulations shown in the text. For one example of this type of approach, see James J. Heckman and George J. Borjas, "Does Unemployment Cause Further Unemployment? Definitions, Questions and Answers from a Continuous Time Model of Heterogeneity and State Dependence," *Economica*, August 1980, pp. 247–83.

[24] One could undoubtedly list many "factors" which might be associated with extensive joblessness, such as kinds of jobs held, wages, family income, education, and so forth. No attempt has been made here to disaggregate the data into such cells because, especially among youth, the sample sizes are simply too small.

[25] Although not shown here, it should also be noted that there is evidence from the matched files that length of time worked in one year is strongly and positively associated with the probability of working again the following year. There are also some important differences among demographic groups. Black workers, particularly teenagers, are less likely than whites to have had any employment experience at all and less likely to have had subsequent employment regardless of the number of weeks worked the previous year. This is a result both of young blacks' higher probability of experiencing an employment separation and, once separated, the greater difficulty they have in finding a job. There are also differences in "persistence" between the major activity groups: The school group's current working experience is somewhat less related to weeks worked during the past year compared to the other group.

Unemployment insurance laws: changes enacted during 1981

All States tightened work requirements; most adopted a variety of options to the pension offset provision, and a few imposed a 1-week waiting period

DIANA RUNNER

All States enacted legislation last year tightening eligibility for extended unemployment insurance benefits, in accordance with the Federal Budget Reconciliation Act of 1980. "Suitable work" requirements were added, and workers filing an interstate claim no longer are eligible for more than 2 weeks of extended benefits if an extended benefit period is not in effect for the week in the State where the claim is filed.

Sixteen States enacted a compensable waiting week requirement for regular unemployment insurance claims so they can be reimbursed for 50 percent of the Federal share of the first week of extended benefits payable to an individual.[1]

Most States have changed their pension offset provision to reflect the variety of options available under the Federal law. Variations are as follows: 26 States offset a pension only if the pension or retired pay, annuity or similar periodic payment is under a plan maintained (or contributed to) by a base period or chargeable employer;[2] 21 States permit benefits to be reduced on less than a dollar-for-dollar basis by taking into consideration the amount of contributions made by the individual for the pension;[3] 15 States disregard pension payments if the base-period employment did not affect eligibility for or increase the amount of the pension;[4] however, excluded from this exemption are pensions paid under the Social Security Act and the Railroad Retirement Act.

The following is a summary of some significant changes in State unemployment insurance laws during 1981.

Arizona

Benefits. Established a permanent voluntary work-sharing program, if it is agreed to by the employer and union and approved by the State agency.

Coverage. The exclusion from coverage of aliens performing agricultural labor will continue until their status changes under the Federal law.

Disqualification. The disqualification for misconduct was changed from a flat period beginning with the week following the filing of a claim plus 10 weeks with benefits reduced by eight times the weekly benefit amount to a duration disqualification and until the individual earns five times the weekly benefit amount.

Administration. The time period for appealing an appeals board decision to the court of appeals was decreased from 35 to 30 days.

Arkansas

Benefits. The qualifying wages were changed from 30 times the weekly benefit amount earned in two quarters of the base period to 30 times high-quarter wages divided by 26 and earn-

---

Diana Runner is an unemployment program specialist in the Office of Research, legislation and Program Policies, employment and Training Administration, U.S. Department of Labor.

ings in two quarters. An individual's weekly benefit amount will be computed as 1/52 of his or her total wages for insured work in the two highest quarters of the base period and, beginning January 1, 1984, the computation will be 1/26 of total wages during the high-quarter of the base period. From July 1, 1981, to January 1, 1984, the minimum weekly benefit amount will be increased from $15 to $31 and the maximum weekly benefit amount will be frozen at $136. From January 1, 1984, through June 30, 1984, the maximum weekly benefit amount will be determined as 66-2/3 percent of the State average weekly wage for insured employment during 1982 and the minimum weekly benefit amount will be determined as 15 percent of the statewide average weekly wage during 1982. A temporary requalification requirement was added until December 31, 1983, providing that an individual may not requalify for benefits in a second benefit year unless he or she has wages of at least 30 times the weekly benefit amount and wages in at least two quarters of the base period and, subsequent to filing the claim establishing his or her previous benefit year, has been paid wages equal to 10 (formerly 6) times his weekly benefit amount.

Disqualification. Until December 31, 1983, the maximum potential benefits of an individual who is disqualified because of misconduct in connection with work or for failure to apply for or accept suitable work, will be reduced by an amount equal to eight times the weekly benefit amount, but benefit duration may not be reduced to less than 1 week. Also, until January 1, 1984, an individual who voluntarily left a base-period employer without good cause will have the base-period wages paid by that employer reduced by 25 percent. The weekly benefit amount, maximum benefit amount, and potential duration of benefits will be determined accordingly, but the maximum benefit entitlement may not be reduced to less than the weekly benefit amount. In addition to the 14 weeks of disqualification which apply to an individual who makes a false statement or misrepresentation, a disqualification of 3 weeks (formerly 2) will be imposed for each week of falsification.

Financing. The taxable wage base for 1982 and 1983 was increased from $6,000 to $6,900 and for 1984 and the following years, reduced to $6,000. The level of the stabilization tax will depend on the solvency of the fund and may range from 0.1 to 0.5 percent. The range of rates for positive-balance employers will be 0.7 to 3.3 percent and negative-balance employer rates will be 5.5 percent for 1982 and 6.0 percent for 1983 and subsequent years. The prohibition against charging an employer for benefits paid when the base-period wage credits represent regular part-time employment and the claimant continues in that employment during the period for which benefits are paid was repealed.

Administration. The period in which an overpayment may be recovered or deducted from future benefits was increased from 1 to 2 years. A judicial review of unemployment compensation cases will now be taken to the court of appeals rather than the circuit court.

Colorado

Coverage. An individual in the employ of a corporation of which he or she is the majority or controlling shareholder and an officer is excluded from coverage.

Disqualification. A Head Start program that is not a part of a school administered by a board of education is excluded from the definition of "educational institution" for purposes of applying the between-terms denial because the Head Start employees are not subject to the same employment conditions as other employees of the school. An individual's weekly benefit amount will not be reduced if he or she is receiving military service-connected disability benefits paid by the Veterans' Administration, but will be reduced because of receiving a military disability retirement pension based on the previous work of the individual.

Penalties. The penalty for fraud was amended to require an individual who received benefits through fraudulent misrepresentation to repay 1½ times the benefits received. Formerly, an individual was required to repay only the weekly benefit amount he received.

Financing. Benefits paid that will be charged against the fund and not against an employer's account will also include combined wage claims in which Colorado wages are transferred to another State. Also, benefits may be noncharged if an individual was disqualified for voluntary leaving and misconduct.

Administration. The local Government Advisory Council was abolished.

Connecticut

Disqualification. Conduct constituting larceny in the third degree was added to the definition of misconduct.

Financing. If the administrator finds than an individual's most recent separation from a base-period employer results in disqualification for leaving work to study or voluntary retirement, benefits will not be charged, provided the employer filed a notice for appeal.

Administration. The name of the appeals division was changed from the Unemployment Commission to the Employment Security Appeals Division and the second-stage appeal body was changed from a commission to a board. The Rural Manpower Services Advisory Council was abolished.

Delaware

Benefits. Dismissal payments which the employing unit is not legally required to make and holiday pay were included in the definition of wages. The computation of the weekly benefit amount was changed from 1/26 of total wages during the high quarter to 1/104 of the individual's total wages during the base period. The change in the computation of the maximum weekly benefit amount from 63 to 66-2/3 percent of the State average weekly wage was delayed from 1981 to 1983. The seasonal provisions of the law were deleted.

Financing. The contribution rate was increased from 5 to 7 percent and no employer's basic assessment rate will be less than 6.3 percent (formerly 2.7) unless all previous assessments have been paid.

Florida

Benefits. The maximum weekly benefit amount was increased from $105 to $125.

Disqualification. An individual will be disqualified for any week the unemployment is because of a suspension for misconduct connected with work or is because of a leave of absence, if the leave was voluntarily initiated by the individual.

Administration. The Advisory Council was extended until October 1, 1987, and the members of the council shall be appointed by the Secretary of the Department of Labor and Employment Security (formerly appointed by division).

Georgia

Benefits. The maximum weekly benefit amount was increased from $90 to $115. The seasonal provisions of the law were deleted.

Coverage. The exclusion of services performed by participants in Comprehensive Employment and Training Act/Public Service Employment programs will not apply if the State's unemployment fund is reimbursed for benefits paid from Federal funds provided for that purpose. The exclusion from coverage of aliens performing agricultural labor was extended to January 1, 1982.

Disqualification. The requalifying requirement was amended for purging a disqualification for voluntary leaving and refusal of "suitable work" to require that the wages earned must be in insured work. A duration disqualification for specific misconduct discharges was added, with requalification earnings of eight times the weekly benefit amount in bona fide work. The duration disqualification will apply if the individual was discharged for intentional conduct which resulted in physical assault, bodily injury, or property loss or damage amounting to $2,000, theft, sabotage, embezzlement, or falsification of an employer's records.

Administration. The members of an appeals tribunal were changed from referees to administrative hearing officers and the administration of the first level of appeal was transferred from the Board of Review to the commissioner.

Illinois

Benefits. The minimum base-period qualifying wages were increased from $1,400 to $1,600 and the amount that must be earned outside the high quarter was increased from $385 to $440. The base period was changed from the four calendar quarters ending 4 to 7 months before the beginning of the benefit year to the first four of the last five completed calendar quarters immediately preceding the benefit year.

Disqualification. Good cause for voluntary leaving must be for reasons attributable to the employing unit. However, the voluntary leaving disqualification will not apply if an individual is physically unable to work or leaves work to care for a spouse, child, or parent who is in poor physical health; leaves work to accept other work that he performs for at least 2 weeks or that pays him at least twice his weekly benefit amount; leaves work rather than accept a transfer that would cause another employee to be bumped; leaves work because of sexual harassment by another employee with the employer's knowledge; or leaves work that would be deemed unsuitable. The requirement for purging disqualifications for the three major causes was changed from an alternative of weeks of work and earnings or weeks of otherwise compensable unemployment to a requirement that the individual have earnings in covered employment of not less than his current weekly benefit amount in each of 4 calendar weeks. Also, an individual cannot be disqualified for refusing to apply for or accept work if the position offered by an employing unit is a transfer to other work and the acceptance would separate an individual currently performing the work. The recoupment period following a finding of eligibility during which benefits were erroneously paid was extended from 1 to 3 years.

Financing. The taxable wage base was increased from $6,500 to $7,000. An employer's account will be relieved from charges for voluntary quit if the claimant left work, took another job, held it long enough to earn six times the weekly benefit amount, and then was separated from the new work. Also noncharged are benefits paid if an employer continues to employ the claimant in part-time work to the same extent as in the base period. The contribution rate for employers paying total quarterly wages less than $50,000 was limited to a maximum of 2.7 percent of wages paid; and for any calendar year in which emergency contribution rates are in effect, the maximum contribution rate for employers paying quarterly wages less than $50,000 will be 3.1 percent of insured quarterly wages. The emergency contribution rate for an employer whose regular contribution rate is two-tenths of 1 percent or higher will be the sum of the regular rate plus four-tenths of 1 percent. The rates for the most and least favorable schedules were increased from the current range of 0.1 to 5.0 percent to 0.2 to 5.3 percent.

Administration. The period for appealing either a claims adjudicator or referee decision was extended from 14 to 30 days.

Indiana

Coverage. Individuals performing services in a work-relief or work-training program will be excluded from coverage.

Disqualification. The pension offset provision was amended to add that Old Age, Survivors Insurance benefits will be considered payments under a plan of an employer maintained or contributed to by a chargeable employer. The disqualification for failure to apply for or to accept suitable work under the regular program was changed from the week of failure or refusal and until the individual earned eight times the weekly benefit amount to the week of failure or refusal and until the individual earns wages equal to his or her weekly benefit amount in each of 4 weeks.

Iowa

Financing. A reimbursing employer will not have benefits charged when the reimburser is a base-period employer and continues to provide the same employment to the individual during the benefit year as during the base period. The period of chargeability required to qualify for a computed rate was increased from 2 to 5 years. However, the 2-year chargeability requirement is retained for an employer with a negative percentage of excess whose account has been charged for more than 26 times the maximum weekly benefit amount for an individual with four dependents or more. An additional surcharge of 0.5 percent was added for employers who have a negative balance for two consecutive rate computation dates and a cumulative 0.5-percent surcharge is now added for each successive year of negative balance, but the surcharge may not exceed 3 percent of taxable wages.

Louisiana

Disqualification. The disqualification applied for voluntary leaving and misconduct discharges will be assessed for separations from any base-period or subsequent employer. Also, an individual who has been disqualified for voluntary leaving or misconduct will requalify after he has been paid wages equal to at least 10 times the weekly benefit amount subsequent to a claim for a compensable week for unemployment benefits, rather than subsequent to the week in which the disqualifying act occurred as was previously provided.

Financing. The rated governmental employer provisions providing a special financing option for political subdivisions was deleted. Nonprofit organizations and political subdivisions which make payments in lieu of contributions will not be charged for benefits paid because of prompt payment or administrative error if the claimant was not entitled to the benefits. In addition, the Louisiana law provides for not charging a reimbursing employer for benefits paid to an individual who continues to remain in the employ of a base-period employer with no reduction in the number of hours worked or wages paid.

Maine

Disqualification. Total or partial weekly benefit amounts will be reduced by the amount of holiday pay an individual has or is entitled to receive for that week. For nonfraudulent overpayments, no more than 10 percent can be withheld weekly from a claimant's unemployment benefit amount.

Financing. The contribution rate computation date was changed from December 31 to June 30 of each calendar year and the effective date of the contribution rate from July 1 to January 1 of each calendar year. A successor employer's contribution rate from the date of acquisition to the end of the current rate period will be the rate determined immediately prior to acquisition. A newly computed rate for the successor will be determined by combining the experience of the predecessor and successor as of the regular computation date (formerly, the rate period in which the acquisition took place) for subsequent contribution rate periods.

Administration. An appeal from a determination may be extended an additional 15 days for good cause.

Maryland

Benefits. The maximum weekly benefit amount was increased from $120 to $140 and the step-down provision was changed from three to six lower divisions on the benefit schedule.

Eligibility. A valid circumstance for voluntary leaving is specified as only a substantial cause which is directly attributable to, arising from, or connected with the conditions of employment or actions of the employer, or another cause of necessitous or compelling nature such that the individual had no reasonable alternative other than to leave the employment. Also, an individual who resigns because of poor health or to care for an ailing relative must furnish a written statement by a physician or hospital or other documentary evidence of the health problem. The time limit for recoupment of overpaid benefits will be 3 years from the date benefits were paid, and after 5 years any amount not recouped may be deemed uncollectible.

Financing. The rate for newly covered employers is the higher of 1.0 percent or State's 5-year benefit-cost ratio, or the contribution rate which applies to employers with a benefit ratio of .0000, not to exceed 2.8 percent (formerly 2.7).

Michigan

Benefits. For a temporary period of March 1, 1981, to April 1, 1983, the following changes will apply: the number of "credit weeks" needed to establish a benefit year increased from 14 to 18 and the definition of "credit week" was changed from $25 or more to one in which the claimant earned wages equal to at least 20 times the State's minimum hourly wage. Also, the weekly benefit amount will be computed at 70 percent of an individual's after-tax weekly wage, up to 58 percent of the State's average weekly wage.

Disqualification. The waiver of the work search requirement for claimants enrolled in and attending classes as a full-time student has been suspended until April 3, 1983. A special disqualification provision for voluntary leaving and misconduct discharges has been established to apply after March 1, 1981, and before April 1, 1983, and requires requalifying earnings of the lesser of 7 times the weekly benefit amount or 40 times the State's minimum hourly wage times 7, and the reduction in an individual's total entitlement will not apply during this period.

Administration. The agency may waive recovery of improperly paid benefits if the payment was not the fault of the individual and if repayment would be contrary to equity and good conscience.

Mississippi

Coverage. Employment for governmental entities and nonprofit organizations will not include services performed as part of a work-relief or work-training program assisted or financed in whole or part by any Federal or State agency or political subdivision, unless coverage of such service is required by Federal law. Also, employment for participants in Comprehensive Employment and Training Act/Public Service Employment programs unless coverage is Federally required.

Montana

Administration. The Division of Employment Security and its bureaus were abolished and their functions will continue in the Department of Labor and Industry.

Nevada

Financing. The proportional charging of benefits was changed to provide that an employer who has paid 75 percent of a claimant's base-period wages will be charged (except those for which a reimbursing employer is liable) with all benefits paid, but the agency may not charge benefits paid after a voluntary quit or a misconduct discharge if employer provides appropriate evidence to the agency. The range of rates for the most favorable schedule was changed from the previous 0.6 to 3.0 percent to 0.3 to 3.6 percent and the maximum rate in the least favorable schedule, from 3.5 to 4.1 percent.

New Hampshire

Benefits. The qualifying wages were increased from $600 to $800 in each of two calendar quarters. The minimum weekly benefit amount was increased from $21 to $26 (annual earnings of $1,700) and the maximum weekly benefit amount from $114 to $132 (annual earnings of $16,500).

Coverage. Temporary services performed for a political committee or candidate for election in a primary or general election is excluded from employment except services for the permanent State committee or national committee of any political party.

Disqualification. An individual's benefits will not be reduced if he or she is paid for a State legal holiday or for any full day which management observes as a holiday with a general closing of business, provided the number of paid holidays does not exceed the total number of legal holidays in a year.

Administration. The terms of office for advisory council members were changed from 1 to 3 years. A Board of Review was established for second-stage appeals (formerly, New Hampshire provided for only one administrative appeal which was the first-stage appeals body) with a 15-day appeal period of the first-stage appeals body decision. Also, the judicial review appeal body was changed from the Superior Court of the county where the claim was filed to the State Supreme Court.

Penalties. The penalty for fraudulent misrepresentation was changed from a fine of not less than $20 nor more than $200 or imprisonment of not more than 1 year, or both, to a misdemeanor.

New Mexico

Disqualification. Extends a denial of benefits to any school employee for any week during a period of paid sabbatical leave provided in the individual's contract, and during an established and customary vacation period or holiday recess if the individual performs such services before sabbatical leave, vacation, or holiday recess and there is a reasonable assurance that he or she will perform the services following the sabbatical leave, vacation, or holiday recess. The period of disqualification for failure without good cause to accept work when offered or to apply for available suitable work when directed or referred by the agency was changed from 1 to 13 weeks following the week of failure to a duration disqualification and until the claimant earns at least five times the weekly benefit amount.

New York

Disqualification. The voluntary leaving disqualification will not apply if an individual under a collective bargaining agreement or written employer plan exercises his option to be separated with the employer's consent for a temporary period when there is a temporary layoff because of lack of work. An individual who is otherwise eligible for benefits will not be deemed unavailable solely because he is serving on a grand or petit jury.

North Carolina

Benefits. The qualifying requirements were changed from base-period wages of at least $565.50 and high-quarter wages of not less than $150 to base-period wages of at least six times the State's average weekly insured wage and 1½ times the high-quarter wages and the high-quarter wages must equal 1½ times the State's average weekly insured wage. The weekly benefit amount payable to a partially unemployed individual must equal the difference between the weekly benefit amount and that part of the wages paid in excess of 10 percent (previously one-half of the weekly benefit amount) of the average weekly wage in the high quarter of the base period.

Coverage. Services performed by an individual on a fishing boat are exempted if the individual is working under an arrangement with the boat owner or operator which provides no cash other than a share of the boat's catch or a share of the proceeds from the sale of the catch. However, the exemption applies only if the boat's operating crew is made up of fewer than 10 individuals and the exclusion will not apply if a Federal unemployment tax is assessed on the service.

Disqualification. Benefits are denied between two successive academic years or during a similar period between two regular terms based on services performed for secondary schools on a part-time or substitute basis.

Financing. An employer who employs a claimant part time in the base period and continues to give substantial equal part-time employment is not charged for benefits. A contributing nonprofit employer that elects to change to a reimbursement basis may be relieved of the requirement to pay a quarterly 1.0-percent tax under certain conditions.

North Dakota

Disqualification. The definition of suitable work was changed so that, after an individual has received 18 weeks of benefits, suitable work will be any work that pays wages equal to the maximum weekly benefit amount, provided that consideration is given to the degree of risk involved to the individual's health, safety, morals, physical fitness, and the distance of the work from his residence. The labor dispute disqualification was changed from any week in which the claimant's unemployment is because of a work stoppage to any week in which the unemployment is because of a strike, sympathy strike, or a claimant's work stoppage dispute of any kind. The requalifying requirement after disqualification for voluntary leaving was changed to require claimants to earn wages in employment equal to eight times the weekly benefit amount instead of five times the weekly benefit amount. The voluntary leaving disqualification will not apply if an individual accepted work which could have been refused with good cause and terminated the employment with the same good cause within the first 10 weeks after starting work.

Financing. The computation date for determining the rate of contributions was changed from December 31 to September 30 and the maximum tax rate is limited to 5 percent. Employers ineligible for an experience-rated computation will pay contributions at a rate equal to the average industry tax rate but not less than 1 percent, except for those in industries where the average tax rate exceeds 3 percent, who will pay at the standard rate.

Oklahoma

Disqualification. Educational institutions operated by the Department of Human Services are excluded, if not inconsistent with Federal law, from the nonprofessional between-terms denial. An individual will not be denied benefits for voluntary leaving if the claimant exercises his option of accepting a layoff pursuant to a union contract or an established employer plan. Recovery of nonfraudulent overpayments continues into the next subsequent benefit year that begins within 1 year of the expiration of the current benefit year.

Oregon

Benefits. The qualifying requirement was increased from 18 weeks of work with an average of $20 per week and total base-period wages of $700 to 18 weeks of work and total base-period wages of $1,000. The computation of the maximum weekly benefit amount was changed from 55 to 58 percent of the State average weekly wage beginning October 4, 1981, and will be increased to 60 percent beginning July 4, 1982, and 64 percent beginning July 4, 1983.

Disqualification. Oregon now provides for a denial of benefits to professional and nonprofessional employees of educational service districts between school terms and during customary vacation periods or holiday recesses. An individual's performance of voluntary services for a charitable organization or governmental entity, without pay, will not prevent that individual from being considered unemployed. The requalifying conditions for benefits after a disqualification were modified by adding that an individual must perform service in employment subject to Oregon law or as an employee of an employing unit in Oregon or any other State or Canada or as a Federal employee. The disqualification for voluntary leaving because of marital obligations, to be married, or to accompany a spouse was deleted. Also, Oregon deleted the alternative requirement that a disqualification for voluntary leaving, misconduct, or refusal of work may be satisfied if claimant has in 8 weeks registered for work, been able to and available for work, actively seeking work, and unable to obtain suitable work. An individual disqualified for voluntary leaving, discharge for misconduct, or refusal of suitable work will have his benefit rights reduced by eight times his weekly benefit amount but not less than the weekly benefit amount unless he or she has previously received benefits during the benefit year.

Financing. The minimum tax rate under the most favorable schedule was decreased from 1.2 to 0.9 percent and under the least favorable schedule from 2.6 to 2.2 percent.

Administration. The time limit for appealing a referee decision to the Employment Appeals Board was increased from 10 to 20 days.

South Carolina

Coverage. Services performed by an individual in a work-relief or work-training program are excluded unless the Federal law mandates the coverage.

Benefits. The seasonal employment provisions of the law were repealed.

Administration. The time for reconsideration of an initial determination was increased from 7 to 10 days.

South Dakota

Benefits. The computation of the weekly benefit amount was changed from 1/22 to 1/26 of high-quarter wages and the qualifying requirement was increased from base-period wages in other than high quarter of at least 20 times the weekly benefit amount and high-quarter wages of $600 to base-period wages in other than the high quarter of at least 30 times the weekly benefit amount and high-quarter wages of $728.

Disqualification. The pension offset provision was amended to require an individual's weekly benefit amount to be reduced by the entire prorated amount of any pension, annuity, or retirement payment including disability pension payments based on the individual's previous work. Military service-connected disability payments are exempted from the offset. South Dakota now provides that it is good cause for voluntary leaving if an individual accepted employment while on layoff and subsequently quit to return to work for his regular employer.

Financing. All employer contribution rates were increased by 0.4 percent. However, the rate increase may not be credited to the employer's experience-rating account. The fund balance required for determining the range of rates was changed for the least favorable rate schedule from $5 million to $5.5 million. An employer's experience-rating account may not be charged for benefits paid to individuals based on total base-period wages of less than $100 earned from one employer.

Administration. The Secretary may waive or cancel recovery of an overpayment if the claimant has been duly discharged by a Federal bankruptcy court, the claimant died, or if the overpayment has been outstanding for 10 years or more.

Tennessee

Benefits. The earnings disregarded for computing partial benefits were increased from $20 to $30.

Disqualification. An individual who receives regular wages for a vacation period under terms of a labor-management agreement will have his weekly benefit amount reduced by the amount of the wages received, but only if work will be available for the individual with the employer at the end of the vacation period.

Texas

Disqualification. The disqualifications for voluntary leaving, misconduct, and refusal of suitable work were changed from a variable period of from 1 to 25 weeks (1 to 13 for suitable work) to a duration disqualification and until the individual requalifies by working 6 weeks or earning wages equal to six times the weekly benefit amount. Also, an individual who voluntarily leaves work to move with a spouse from the area where they worked will be disqualified from 6 to 26 weeks. An individual will be disqualified for voluntarily leaving work if he or she left because of a medically verified illness, injury, disability, or pregnancy, even though still available for work. However, an individual will not be disqualified whose work-related reason for separation was urgent, compelling, and of a necessitous nature. Texas repealed the requirement that benefits must be reduced by an amount equal to the number of weeks of postponed benefits for voluntary leaving, discharge for misconduct, or refusal of suitable work. Misconduct is defined to include any action that places others in danger or an intentional violation of employer policy or law, but does not include an act that responds to an unconscionable act of the employer.

Vermont

Benefits. The definition of "wages" was redefined, for purposes of determining whether an individual is partially unemployed, to include that part of one's weekly remuneration which is in excess of $15 for the individual plus $3 for each dependent, rather than the amount in excess of $10, as previously defined.

Disqualification. Any individual who was fired because of inability to perform the job because of a felony or misdemeanor conviction will be disqualified for benefits. Also, Vermont now disqualifies any individual who, during a job interview, made false statements, showed an unreasonable lack of interest, or whose behavior was calculated to preclude an offer of work. However, no individual will suffer more than one disqualification for any one disqualifying act. Holiday pay, backpay awards, and compensation for temporary total disability were included as disqualifying income.

Administration. The name of the State agency was changed from the Department of Employment Security to the Department of Employment and Training.

Virgin Islands

Coverage. Services performed under the Comprehensive Employment and Training Act (CETA) will be excluded unless required by Federal law.

Disqualification. A denial of benefits was extended to nonprofessional school employees during a period between 2 successive academic years and to any school employee for any week during an established or customary vacation period or holiday recess if the individual performs the services in the first of such academic years or terms or immediately before such vacation or holiday recess and there is a reasonable assurance that the individual will perform the services in the second of such academic years or terms and also immediately following a vacation or holiday recess. An individual will be disqualified if he did not make reasonable efforts to seek work on his own initiative. The disqualifications for voluntary leaving, misconduct (including disciplinary suspensions), and refusal of suitable work were changed from a 6-week disqualification or for the period of unemployment immediately following separation, whichever ends sooner, to a duration disqualification which continues until the individual has been employed at least 4 weeks and earns at least four times his weekly benefit amount. Also, the labor dispute disqualification was changed from any week in which an individual's unemployment is caused by a stoppage of work because of a labor dispute to a labor dispute in active progress. The disqualification for fraudulent misrepresentation was changed from the week of determination plus 52 weeks to the week the determination is mailed or delivered plus 51 weeks.

Financing. The taxable wage base was increased from $6,000 to $8,000.

Virginia

Benefits. The maximum weekly benefit amount was increased from $122 to $138 and the minimum from $38 to $44 and an individual's weekly benefit amount will be determined on the wages earned in the highest two quarters (previously one) in the base period. The amount of base-period wages needed to qualify for benefits was increased from $1,368 to $2,200. The 1-week waiting period was repealed.

Coverage. Services performed by an individual as a public service employee under CETA and as a temporary employee of the General Assembly were excluded from coverage. However, Virginia included services performed in agricultural labor by aliens admitted to the United States to perform such labor.

Disqualification. If the Federal Unemployment Tax Act is amended to include nonprofessional employees of institutions of higher education in the between-terms denial provisions of the law, the denial will become simultaneously effective under the Virginia law.

Financing. Benefits paid to claimants during the appeals process in a disputed claim will be charged to the nonprofit organization or governmental entity even though the claimant may be found totally or partially ineligible for benefits. The maximum basic experience rate was increased from 4.5 to 6.2 percent and the rate for newly subject employers was increased from 2.0 to 2.5 percent. The formula for determining experience rating changed from a benefit-wage ratio, which measures the relative experience of employers by the separation of workers which result in benefit payments, to a benefit ratio which is determined as a percentage obtained by dividing the employer's benefit charges for the preceding fiscal year by the total payroll for the same period. An unspecified poll cost charge and a fund-building rate of 0.2 percent will be added if the fund balance factor is 50 percent or less for a year.

Administration. The statutory limitation within which a disqualification for fraudulent misrepresentation may be imposed was changed from 2 to 3 years and the provision deleted which limits the ineligibility of a claimant for benefits for up to 5 years for fraud if the benefits are not repaid. Also, the commission may determine as uncollectible or purge any unpaid benefit overpayment upon the death of the person or upon the individual's discharge in bankruptcy occurring after the determination of overpayment.

Washington

Coverage. Excludes, at the discretion of the employer, services performed by corporate officers.

Disqualification. A disqualification for voluntary leaving will continue if the work obtained to purge the disqualification is a mere sham to qualify for benefits and not bona fide work. In determining whether the work is bona fide, factors to be considered include the duration of work, the extent of direction and control by the employer over the work, and the level of skill required for the work in light of the individual's training and experience.

West Virginia

Benefits. An individual will be considered partially unemployed if he or she has weekly earnings of at least $26 and, if less than $26, a person will be considered totally unemployed. Formerly, an individual was considered partially unemployed if the weekly wages were less than the weekly benefit amount plus $25. A partially unemployed individual must serve a 1-week waiting period.

Disqualification. The disqualification for voluntary leaving was changed from a 6-week disqualification with an equal reduction in maximum benefits to a duration disqualification or until the individual returns to covered employment and has been employed for at least 30 working days. West Virginia added to the disqualification for refusal of suitable work that the total benefit entitlement will be reduced by an amount equal to four times the individual's weekly benefit amount. The definition of gross misconduct was amended to add that it shall include but not be limited to any act of misconduct where the individual has received prior written warnings that termination of employment may result from that act. The disqualification for fraudulent misrepresentation to obtain benefits was changed from a variable 5 to 52 weeks to a flat 52 weeks. Deleted was the requirement that for each week of disqualification for fraudulent misrepresentation, an additional 5-week disqualification would be imposed.

Penalties. The fine for fraud, upon conviction, was increased from not less than $20 or more than $50 to not less than $100 or more than $500 or by imprisonment for not longer than 30 days or both.

Financing. The taxable wage base was increased from $6,000 to $8,000. A newly covered employer's tax rate will be 2.7 percent, except that out-of-State corporations or business entities in the construction trades will pay 7.5 percent. The tax rate of employers who do not have 36 months of chargeability was increased from 1.5 to 2.7 percent. Benefits paid to an individual who voluntarily leaves work without good cause involving fault on the part of the employer will no longer be noncharged. The fund requirement for the most favorable schedule was changed from $110 million to 150 percent of average benefit payments for the 3 preceding calendar years with the rates ranging from 0 to 7.5 percent and the fund requirement for the least favorable schedule from $60 million to 100 percent of average benefit payments for the 3 preceding years with the rates ranging from 1.5 to 7.5 percent. A 1-percent surtax will be added to each employer's rate until the trust fund assets equal or exceed the average benefit payments from the fund for 3 preceding years. Partial benefits paid to an individual will be charged to the account of the last employer for whom he worked 30 working days.

Administration. The first-stage appeals body was changed from an examiner to an administrative law judge.

Wisconsin

Disqualification. The disqualification for voluntary leaving will not apply if the individual left or lost employment because he or she reached the firm's compulsory retirement age.

Wyoming

Financing. The new employer bonding requirements applicable to new contributing employers were repealed. ☐

Workers' compensation: key legislation in 1981

Higher benefit levels, broader coverage, and improved medical and rehabilitation services are among the actions taken by States to provide better protection for injured workers

LAVERNE C. TINSLEY

Forty-nine States, Puerto Rico, and the District of Columbia were in legislative session during 1981.[1] Deliberations resulted in the introduction of more than 1,500 proposals and enactment of more than 100 laws dealing with workers' compensation. Coverage and benefits were addressed in most of the amendments as in previous years. Numerous administrative changes were also made and medical and rehabilitation services for injured workers were improved.

Workers' compensation coverage was revised by new enactments in 19 States. These revisions extended coverage to workers including apprentices or students in work training or educational programs in four jurisdictions and to specified volunteers serving as State employees in emergency situations.

Forty-six jurisdictions and the District of Columbia raised their maximum weekly benefit levels for total disability and death either statutorily or according to increases linked to each State's average weekly wage. (See table 1.) Total maximums were increased in Arkansas, Mississippi, and Tennessee.

Effective January 1, 1982, Michigan became the second State, after Iowa, to establish maximum weekly benefit levels for disability and death at 80 percent of spendable earnings. Spendable earnings are defined as the employee's gross wage less State and Federal income taxes and social security where appropriate. Previously, maximum weekly benefits in these States were established at 66-2/3 percent of the employee's average weekly wage before taxes.

One State, Maine, rescinded legislation that would have increased maximum weekly benefits to 200 percent of the State's average weekly wage on July 1, 1981. Thus, benefits remain at 166-2/3 percent of the State's average weekly wage.

Legislation was also enacted in Maine which permits injured workers to select their own physician or surgeon from those licensed to practice in the State. Previously, workers were required to select physicians from a panel provided by the State workers' compensation agency.

The laws of Montana, Nebraska, North Carolina, Oregon, and Virginia were amended to increase burial allowances.

Several States updated their rehabilitation provisions for injured workers. For instance, unemployed dependent surviving spouses in Minnesota are now eligible to apply for rehabilitation. The intent of this legislation is to allow dependent surviving spouses the opportunity to

---

LaVerne C. Tinsley is a workers' compensation specialist in the Division of State Workers' Compensation Standards, Office of Workers' Compensation Programs, Employment Standards Administration, U.S. Department of Labor.

Table 1. Jurisdictions that increased maximum weekly temporary total disability benefits during 1981

Jurisdiction	Former maximum	New maximum
Alabama	$148.00	$161.00
Alaska	$650.00	$858.00
Arkansas	$126.00	$140.00
California	$154.00	$175.00
Colorado	$244.65	$261.80
Connecticut	$285.00, plus $10 for each dependent under 18 years of age not to exceed 75 percent of employee's wage	$310.00, plus $10 for each dependent under 18 years of age not to exceed 75 percent of employee's wage
Delaware	$175.28	$194.81
District of Columbia	$456.24	$496.70
Florida	$211.00	$228.00
Georgia	$110.00	$115.00
Hawaii	$215.00	$235.00
Idaho	$181.80 to $252.50 according to number of dependents, plus 7 percent of SAWW for each child up to 5	$198.00 to $275.00 according to number or dependents plus 7 percent of SAWW for each child up to 5
Illinois	$376.33	$394.19
Iowa	$384.00	$501.00
Kansas	$170.00	$187.00
Kentucky	$217.00	$233.26
Louisiana	$164.00	$183.00
Maine	$332.16	$367.25
Maryland	$241.00	$248.00
Massachusetts	$245.48, plus $6 for each dependent; aggregate not to exceed worker's average weekly wage or $150	$269.93, plus $6 for each dependent; aggregate not to exceed worker's average weekly wage or $150
Michigan	$171.00 to $200.00 according to number of dependents	$181.00 to $210.00 according to number of dependents
Minnesota	$244.00	$267.00
Mississippi	$ 98.00	$112.00
Missouri	$150.00	$174.00
Montana	$219.00	$241.00
Nevada	$245.09	$270.20
New Hampshire	$213.00	$234.00
New Jersey	$185.00	$199.00
New Mexico	$201.04	$221.50
North Dakota	$213.00, plus $5 for each dependent child; aggregate not to exceed worker's net wage after taxes and social security	$233.00, plus $5 for each dependent child; aggregate not to exceed worker's net wage after taxes and social security
Ohio	$258.00	$275.00
Oklahoma	$155.00	$175.00
Oregon	$261.32	$286.88
Pennsylvania	$242.00	$262.00
Rhode Island	$217.00, plus $6 for each dependent; aggregate not to exceed 80 percent of worker's average weekly wage	$238.00, plus $6 for each dependent; aggregate not to exceed 80 percent of worker's average weekly wage
South Carolina	$197.00	$216.00
South Dakota	$191.00	$208.00
Tennessee	$119.00	$126.00
Texas	$133.00	$154.00
Utah	$230.00, plus $5 for dependent spouse and each dependent child up to 4, but not to exceed 100 percent of SAWW	$256.00, plus $5 for dependent spouse and each dependent child up to 4, but not to exceed 100 percent of SAWW
Vermont	$208.00, plus $5 for each dependent under 21 years of age	$225.00, plus $5 for each dependent under 21 years of age
Virginia	$213.00	$231.00
Washington	$204.66	$223.34
West Virginia	$262.08	$276.26
Wisconsin	$233.00	$249.00
Wyoming	$402.01	$411.21

NOTE: Benefit increases are based on the applicable State's average weekly or monthly wage, and for the District of Columbia, the national average weekly wage. However, 9 States (Arizona, Arkansas, California, Georgia, Indiana, Mississippi, Nebraska, New York, and Tennessee) and Puerto Rico prescribe statutory amounts; 5 States (Arizona, Indiana, Nebraska, New York, and North Carolina) and Puerto Rico are not listed because no increases for temporary total disability were legislated during 1981.

become self-sufficient. Compensation will now be allowed while a workers' potential for rehabilitation is being evaluated in Arkansas.

In Nevada, injured workers may select a second physician from a panel within 90 days after injury (formerly 45 days) if the initial selection proved to be unsatisfactory. Allowances for board, lodging, travel, and maintenance were increased in New Mexico. And in Oregon, workers who fail to enroll in rehabilitation programs may now have their compensation suspended.

More States are penalizing employers for failure to make timely compensation payments and also for failure to make certain notifications regarding claims. In other States, employees are being penalized for not obtaining insurance coverage.

Additional changes were made in State workers' compensation statutes during the year that focused on various administrative procedures and reporting requirements. Six states established study committees to review and recommend improvements in these areas.

Following is a summary of legislation enacted by individual States.

Alabama

County governments are now permitted to cover their officials and employees through group self-insurance programs.

An amendment was proposed to the Alabama Constitution which would prohibit suits by "co-employees" for personal injury, disease, or death arising out of and in the course of employment.

Alaska

The monthly compensation payment during rehabilitation (from the Second Injury Fund) was increased from $100 to $200; and the total maximum compensation during rehabilitation from $5,000 to $10,000.

Employers are newly required to notify the Workmen's Compensation Board within 14 days of any change in a compensation claim. A civil penalty of $100, plus $25 per day, was established for failure to give notice within the specified time period but no fine can exceed $2,500 for each offense.

Arizona

Coverage was extended to State employees who serve as volunteers without compensation in certain search or rescue operations.

Payments by employers or carriers for no-dependency death were decreased from 2 to 1½ percent of all premiums received during the preceding year.

New provisions were established regarding financing of the Special Fund.

Arkansas

Volunteer emergency services workers were included for coverage.

Participants in the State's workfare project, whose sole purpose for participating is to retain food stamps and not for employment within the State, were excluded from coverage.

Maximum weekly benefits for disability and death were raised in two steps. On March 1, 1981, benefits increased to $140 from $126 and on March 1, 1982, benefits will increase to $154. During the same periods, total maximum benefits for temporary total and permanent partial disability increased to $63,000 (from $56,700) and will increase to $69,000. For permanent total disability or death occurring on or after March 1, 1981, the new total aggregate is $75,000, formerly $50,000.

Temporary total disability benefits can now be extended after the first 40 weeks of compensation and beyond for 13-week intervals. Benefits for temporary and permanent total disability will be barred for any week that a claimant can simultaneously receive unemployment compensation benefits.

A limit of $10,000 and 6 months will be placed on all medical services, hospital, and other treatment available to injured workers. In some instances, these services may be waived or extended.

New procedures were adopted regarding employee rights in change of physician.

Injured workers are now eligible to receive up to 6 weeks of compensation while their potential for rehabilitation is being evaluated if they are not working or receiving any benefits.

Lump sum attorney fees will now be discounted at the current rate of 7 percent.

Benefit payments normally made from the Second Injury Fund will revert to the employer at the time of an accident if the Fund becomes insolvent before July 1, 1983.

The penalty for making late compensation payments was increased from 6 to 10 percent of the unpaid benefit.

The requirement that widowers be incapacitated in order to receive compensation was eliminated, thereby allowing widowers the same benefits as widows.

California

Coverage of persons who perform officiating services at amateur sporting events sponsored by public agencies or by private nonprofit organizations was removed. Students participating as athletes in amateur sporting events were also eliminated from coverage.

Colorado

Mandatory coverage is now required of employers who enter into bona fide cooperative educational or student internship programs sponsored by educational institutions for the purpose of providing on-the-job training for students.

Public entities with annual payrolls of at least $1 million are now allowed to become workers' compensation self-insurers or form self-insurance pools if their payrolls are less.

A 52-week time limit was set on benefits paid during vocational rehabilitation or for income maintenance. The maximum ($20,000) on medical aid and vocational rehabilitation was removed.

Chiropractors are now permitted to treat workers' compensation claimants.

In addition to the 1.75-percent premium tax imposed for maintenance of the Major Medical Insurance Fund, another premium tax was added.

Further investment was authorized of moneys in the workers' compensation special funds in the form of notes, loans, bonds, and certain certificates.

The Industrial Commission is newly required to review appealed cases within the scope of the issues presented in the record only.

Connecticut

Participants in work, training, or educational programs approved by the labor commissioner will now be covered for workers' compensation.

Payments for accident and health or life insurance coverage will be borne by the Second Injury Fund in cases where benefits for total incapacity continue for longer than 104 weeks.

A provision was added to the statutes making the last employer or insurer initially liable for payment of compensation. If it is determined that other employers are equally liable for compensation, the commissioner will order them to reimburse the initially liable employer or insurer at a 12-percent interest rate.

By enactment, the State was required to use a private insurance carrier for workers' compensation coverage, and procedures for coverage by private carriers was added to the law.

A Statistical Division was established in the Workers' Compensation Commission to primarily compile and maintain statistics concerning occupational injuries and diseases, voluntary agreements, status of claims, and commissioner's dockets. Funding of the Division will come from the Administrative Cost Fund.

Delaware

Authorization was made for the appointment of a State Disability Reform Committee to recommend legislation to consolidate disability programs.

Florida

Legislation extended the existence of the Workers' Compensation Advisory Council to October 1, 1987. The title of "judges of industrial claims" was changed to "deputy commissioners."

Georgia

Coverage was extended to members of the Georgia National Guard while serving on active duty in the State and to certain volunteer firefighters.

Maximum weekly benefits for disability and death were increased from $110 to $115.

Attorney fees assessed against opposing parties are no longer required to be made in a lump sum.

The requirement that the employer or insurer keep the Administrator of the Subsequent Injury Trust Fund informed of any proposed compensation settlements or agreements was eliminated.

Regulation of group self-insurance funds for workers' compensation was transferred from the Secretary of State to the Insurance Commissioner.

Idaho

Officials who serve at athletic contests involving secondary schools were eliminated from coverage.

Total disability benefits less than the State's current applicable minimum for the first 52 weeks of compensation will thereafter be not less than the State's current applicable minimum, or 45 percent.

Children can now receive death benefits beyond age 18 if they are incapable of self-support for an additional 500 weeks, minus the period benefits were paid prior to age 18.

A maximum of $5,000 was set as payment into the State treasury by employers for no-dependency death cases.

Employers are required to pay interest on all compensation awards due, and at the rate in effect when the award was made. The present rate is 8 percent per annum.

Indiana

Students who are permanently impaired will now receive the same coverage as full-time employees for workers' compensation purposes while performing services for an employer in an approved vocational educational training program.

Iowa

Persons certified by the Council of Accreditation in Occupational Hearing Conservation are now allowed to make audiometric examinations.

Kansas

The medical allowance for selection of another physician by an employee was raised from $150 to $350 for cases where the physician selected by the employer is unsatisfactory.

Louisiana

Sole proprietors are now permitted an exemption from coverage upon request.

The coverage waiver allowed to corporate officers, who own at least 10 percent of the corporate stock, and to partners will be unlimited and apply to all trades, businesses, or occupations conducted by the corporation or partnership. This provision also applies to sole proprietors.

Workers who are employed by a private household and perform services that are not incidental to, or do not arise out of any trade, business, or occupation of the household are specifically excluded from coverage.

Group self-insurance funds are newly required to maintain at least $4 million of excess insurance to secure the payment of all compensation benefits.

The House and Senate Labor and Industry Committees were authorized to direct a study of workers' compensation rate structures and the profit margins of insurance companies.

Maine

Agriculture employment, where 150 cords of wood or less are harvested annually from farm wood lots, and aquaculture employment are removed from coverage provided that their employees are covered by liability insurance of not less than $25,000 and medical insurance of not less than $1,000.

Employees who participate in ridesharing programs and receive no remuneration were exempted from coverage as well as those who receive injuries as a result of voluntary participation in an employer-sponsored athletic team or event.

The increase in maximum weekly benefits based on 200 percent of the State's average weekly wage, effective July 1, 1981, was recinded. Benefits will remain at 166-2/3 percent.

Initial selection of physician or surgeon by an employee is now permitted from a list of those who are licensed to practice in the State of Maine.

Interest and penalties will now be applicable to compensation claims involving State employees who were previously excluded.

An employee with permanent partial disabilities caused partly by a previous injury will be compensated for the entire injury from his or her present employer. The employer will be reimbursed by the Second Injury Fund.

The provision which established the employer's liability for compensation of second injuries and permitted employees to apply for compensation from the Second Injury Fund was repealed.

Employers or insurers may now recover benefit payments made to employees pending an appeal, if the court rules that an employee was not entitled to compensation. The ordering of any repayment of benefits which would cause a hardship or an injustice was prohibited.

Petitions for rehearings are now required to be filed within 30 days of an agreement, award, or decree. Previously, the time limit was 20 days.

Employees or prospective employees are no longer permitted to waive their rights to compensation for an aggravation of an occupational disease.

Upon the discovery of new evidence, the Workers' Compensation Commission can now reopen a workers' compensation case.

Other changes occurred relating to bonding and excess insurance.

Maryland

Coverage was established for volunteer firefighters and rescue workers of Frederick County.

Insurers and self-insurers are allowed to convert, with approval of the Workmen's Compensation Commission, permanent partial disability awards that have not exceeded 51 weeks of benefits to a lump sum without discount, less any attorney fee.

All assets and obligations of the Workers' Compensation Insolvency Fund were transferred to the Maryland Insurance Guaranty Association.

Additional assessments were authorized against insurers and self-insured employers in order to maintain the solvency of the Uninsured Employers' Fund.

The administrator of the Subsequent Injury Fund was authorized to hire any expert to defend the fund, if necessary, when suits are filed against it.

Rules and regulations for group self-insurance will now be developed by the Workmen's Compensation Commission alone, rather than jointly with the insurance commissioner.

Businesses located in urban enterprise zones may be eligible for discounts on insurance premiums paid to the State Accident Fund if certain Federal standards are met.

Michigan

The definition of "public employer" was broadened to include two employers or more in the same industry with combined assets of at least $1 million who pool their liabilities as self-insurers.

Minnesota

Coverage was expanded to include the superintendent of the Bureau of Criminal Apprehension within the application of the law.

A 10-year sliding scale was set up for payment of death benefits which formerly were paid during the lifetime of the recipient.

Permanent partial disability awards will now be paid in a lump sum when the employee returns to work.

Upon request, surviving dependent spouses who are unemployable can now receive rehabilitation.

The time within which an employer is required to make first payment of compensation was reduced from 30 to 14 days.

A medical fee schedule was established with a cap on fees at 75 percent of the usual and customary community charges for the preceding year. Services covered by the fee schedule include medical, chiropractic, podiatric, surgical, hospital, and other health care provider treatment and services.

The burden of proof concerning a work-related injury was made the responsibility of the employee.

Group self-insurance pools are no longer required to consist of employers in the same industry.

Fines charged to uninsured employers were increased from $50 to $500; and up to $2,000 when the employer has five employees or more.

Mississippi

Maximum weekly benefits for disability and death were raised from $98 to $112; and total maximum from $44,100 to $50,400. The weekly minimum benefit of $25 was retained.

The Department of Public Safety is now permitted to become a self-insurer upon proper notification to the Industrial Commission.

Missouri

The provision which exempted from coverage employers with a total gross annual payroll for the preceding calendar year or part of the current calendar year of not more than $10,000 was eliminated.

Minimum weekly benefits for disability and death occurring on or after September 28, 1981, were set at $40. Previously, no statutory minimum was in effect.

Compensation for temporary partial disability was set at 66-2/3 percent of the difference between the average earnings of the employee before the accident and the amount which the employee will reasonably be able to earn during disability. No consideration was previously given to earning capacity during disability when determining benefits.

Permanent partial disability in lieu of all other compensation except for medical and physical rehabilitation expenses was changed. Compensation for permanent partial disability will now be in addition to compensation for temporary total or partial disability.

A fine of $100 per day was added as a penalty against employers who fail to insure or self-insure their liability for workers' compensation, up to a maximum of $5,000. Any fines collected will go to the Second Injury Fund for payments to employees of uninsured employers.

Group self-insurance was authorized and will be regulated by the Division of Workers' Compensation.

Montana

The Workers' Compensation Division was authorized to set fees for medical, chiropractic, and paramedical services, excluding hospital services, based on 90 percent of the usual and customary charges of the medical specialty involved.

Silicosis victims will now receive up to $200 in monthly payments, formerly $175.

The burial allowance was increased from $1,100 to $1,400.

Nebraska

Corporation officers owning at least 25 percent of the corporate stock are permitted to waive coverage.

The burial allowance was raised from $1,000 to $2,000.

Nevada

Apprentices in vocational training classes or receiving bona fide instruction under an apprenticeship committee and receiving at least $150 a month during such periods are covered for workers' compensation.

Volunteers, excluding students, who perform work for private organizations as part of a public program and who are not otherwise covered for workers' compensation will now be entitled to benefits as employees of a public agency.

Some voluntary ski patrollers were excluded from statutory coverage as well as sole proprietors who are no longer domiciled in Nevada.

Compensation is now allowed for both injury and disease provided the combined award does not exceed compensation payable for the total percentage of disability.

Police officers and firefighters who are partially disabled because of occupational diseases and incapable of performing their work are now entitled to partial disability benefits.

Certain employees of the Department of Motor Vehicles are now entitled to benefits for occupational heart or lung disease.

Injured employees who are not satisfied with their initial choice of physician may select another physician from a panel if the choice is made within 90 days after injury, formerly 45 days.

Physicians who testify at hearings are entitled to the same fees as witnesses in civil cases. An appeals officer may order a fee for the physician according to the fee schedule for medical consultations.

Self-insured employers were instructed not to make payments to physicians until an itemized statement of services has been received.

Every self-insured employer is required to furnish the Commissioner of Insurance with specified insurance information to carry out the provisions of the law.

Excess insurance or reinsurance coverage obtained by a self-insured employer must be written by a Nevada carrier.

Several studies were authorized during the year of which the results and recommendations are to be reported to the 62d session of the legislature. One is to be conducted by the Nevada Industrial Commission on the Occupational Diseases Act and the other by the Legislative Commission on the feasibility and desirability of allowing insurance coverage to be provided through private carriers.

New Mexico

The maximum benefit allowable for board, lodging, travel, and maintenance of the family during rehabilitation was increased from $1,000 to $3,000.

New York

Employers are now liable for payment of services provided an injured employee by a self-employed physiotherapist pursuant to written instructions of an authorized physician or podiatrist.

Employers are now required to pay the attorney fees of employees who win discrimination cases.

Appointment of qualified interpretors is now mandatory at hearings in which a deaf person is a party or witness. Interpreting services will be paid out of administrative funds.

Temporary referees of the Workers' Compensation Board must now be qualified with appropriate training or experience.

The definition of "average weekly wage" was expanded to include an alternative calculation of benefits based on total wages of the last 8 weeks immediately preceding disability and excludes the week in which disability began.

North Carolina

Minimum weekly benefits for disability and death were raised from $20 to $30.

The cap ($80) was removed on weekly benefits for National Guardsmen and the weekly maximum applicable to other employees applied (100 percent of the State's average weekly wage).

Maximum weekly compensation for partial incapacity, total disability, or death due to asbestosis or silicosis was changed from $80 to 100 percent of the State's average weekly wage.

The statute of limitations for asbestosis, lead poisoning, and silicosis was amended. Compensation for asbestosis may now be awarded up to 10 years after disablement or death from exposure to such disease. The time limit for lead poisoning remains at 2 years. Silicosis was deleted from the law as a special provision and is now subject to the general statute of limitations for occupational diseases, which is 2 years after disablement or death. There is no provision for death after continuous disablement from silicosis.

The burial allowance of $500 was raised to $1,200.

A carrier or employer who appeals a compensation award must pay 8-percent interest on the final compensation award from the initial filing date if unsuccessful.

If disputes arise between employer and employee concerning the continuance of medical treatment, the Industrial Commission at its discretion may order further treatment.

North Dakota

Maximum weekly death benefits were raised from $90 to $105. Supplementary benefits for permanent total disability and death were increased from 20 to 25 percent of the difference between the benefits a claimant is receiving and the maximum benefits in effect on July 1, 1975.

The burial allowance was raised from $1,000 to $2,000.

A rebuttable presumption was created which specifies that an injury can be attributable to intoxication, based on the alcohol level in the blood.

Allowances for rehabilitation can no longer be ordered in lieu of death benefits where there is a rehabilitation contract.

The filing time for claims was extended from 60 days to no more than 1 year after injury for disability, and from 1 year to 2 years following death.

A legislative council was directed to study workmen's compensation wage base and premium determinations, with special emphasis on the effects the statutorily established maximum payroll base has on premium levels of various employers.

Oklahoma

Two employers or more are now permitted to pool their liabilities to qualify as group self-insurers. Boards of education and institutions of higher education may also qualify as self-insurers for workers' compensation.

A special House and Senate Committee was authorized to study the workers' compensation rate structure of the State Insurance Fund.

Oregon

The burial allowance was raised from $1,000 to $3,000, and the cost of transportation for the decedent's body is now included as part of the burial allowance.

Dependent children, or the surviving spouse for the dependent children, will now be entitled to $150 instead of $100 in death benefits per month.

Workers or their beneficiaries are entitled to recover 33-1/3 percent of an award, up from 25 percent, in third-party cases.

Within 120 days from the date a worker becomes temporarily totally disabled, the insurer or self-insured employer must act to enroll the worker in a physical rehabilitation program, if necessary.

Participants of rehabilitation programs approved by the Workers' Compensation Department are newly entitled to temporary total disability benefits.

Suspension of compensation may be authorized by the Director of the Workers' Compensation Department against a claimant who fails to participate in rehabilitation.

All users of the Department's rehabilitation facility must pay users fees to meet the cost of services and to protect the State against tort and liability claims.

The Department's director was also authorized to enter into contracts for rehabilitation services with private rehabilitation centers if such centers meet the State's licensing requirements.

Travel expenses were granted for employees who travel more than 50 miles from their residence to attend a workers' compensation hearing.

A rebuttable presumption was established that a person is an independent contractor unless such person has qualified either as a carrier-insured employer or a self-insured employer instead of a direct responsibility employer or as a contributing employer.

The State Accident Insurance Fund Corp. may now conduct reinsurance business as well as workers' compensation insurance with Oregon employers.

Rhode Island

Employees will no longer be entitled to receive compensation while incarcerated if they have no dependents.

Qualified employers are permitted to self-insure for a specified sum by furnishing security, indemnity, or bond equal to the particular amount together with insurance for projected losses in excess of such sum.

South Carolina

Fines can now be levied against an employer or carrier for failure to submit certain reports, forms, and records in any phase of the claims process.

Full Commission reviews are now to be conducted by three-member panels composed of commissioners who are appointed by the chairperson, excluding the original hearing commissioner.

Tennessee

The maximum weekly benefits for disability and death were increased from $119 to $126, and total maximum from $47,600 to $50,400.

Sole proprietors and partners who are covered under the workers' compensation law may continue coverage in effect under any other individual or group accident and sickness policy.

Texas

Political subdivisions are newly authorized to provide full medical benefits and minimum compensation payments to injured volunteer firefighters, police, emergency medical personnel, and other specified volunteers.

Lifetime benefits were established for statutorily prescribed permanent total disability awards.

No attorney fees will be allowed in a case where benefits will be paid for life if the employer's insurance company admits liability and makes payments while the case is pending. If liability is admitted, the claimant's attorney is entitled to a reasonable fee.

Claims for compensation under voluntary policies are subject to the jurisdiction of the Industrial Accident Board.

The Assigned Risk Pool may at its discretion insure an individual entity without insuring any combinable entities.

Various duties and authority were granted to the attorney general relating to investigation of possible workers' compensation fraud.

Utah

Payments for temporary total disability were allowed to be extended in certain cases.

Maximum weekly payments for temporary partial disability were increased from 66-2/3 percent to 100 percent of the State's average weekly wage. Additional payments of $5 were authorized for a dependent spouse and each dependent child up to 4, under age 18, but total payment not to exceed 100 percent of the State's average weekly wage.

Minimum weekly benefits for persons entitled to compensation from the Second Injury Fund were increased from $85 to $100.

Vermont

The exemption for agriculture or farm employment was raised from $1,000 to $2,000 per aggregate payroll in a calendar year.

Virginia

The burial allowance was increased from $1,000 to $2,000, and for transportation expenses of the deceased from $300 to $500.

Documentation regarding social security disability benefits will now be required by the Industrial Commission when a claimant files for cost-of-living supplements in order to establish eligibility under the law.

The House and Senate Committees on Labor and Commerce were authorized to establish a joint subcommittee to study the State's laws concerning brown lung disease (byssinosis) and determine if the present laws should be revised.

Washington

Sole proprietors or partners are permitted an exemption from mandatory coverage after certain conditions are met.

Self-insurers can now insure the payment of permanent total disability or death benefits by setting up a bond with the Department of Labor and Industry.

Claims for medical treatment only, not involving permanent disability, may be closed once treatment is concluded.

Wisconsin

The Department of Administration was authorized to administer workers' compensation for State employees and their dependents.

Wyoming

Permanent total disability benefits were increased to 66-2/3 percent of the State's average weekly wage for a maximum of 257 weeks. Previously, a maximum benefit of $30,000 was paid in monthly installments at the rate of the State's average weekly wage as determined quarterly.

Benefits for death were also changed to 66-2/3 percent of the State's average weekly wage for a maximum period of 231 weeks. Previously, $25,000 was paid in monthly installments at the rate of the State's average weekly wage. This enactment also eliminated the provision that allowed surviving spouses, who remarry before the entire award is paid, to receive only $500 of any unpaid balance.

The monthly contribution paid into the Industrial Accident Account by employers who engage in extrahazardous employment was decreased from 1 percent to .75 percent of the monthly earnings of the employee. ☐

——FOOTNOTE——

[1] The following States—Hawaii, Illinois, Kentucky, Massachusetts, New Hampshire, New Jersey, Ohio, Pennsylvania, South Dakota, and West Virginia—convened in 1981 but were not discussed in the State-by-State summary of key amendments to workers' compensation laws.

Select commission suggests changes in immigration policy—a review essay

Tougher enforcement, higher quotas, amnesty for most current illegal aliens, and a 'more reliable' means of checking the legal status of all workers are among the 67 recommendations of a 2-year Congressional panel

PHILIP L. MARTIN

Many believe that immigration to the United States is out of control. Instead of the 450,000 immigrants anticipated in 1980, 808,000 legal immigrants, refugees, and special entrants were admitted, and an unknown number of illegal or undocumented workers, as many as 500,000, entered by various means. Immigration is at an alltime high, exceeding the previous high average of 880,000 per year between 1901 and 1910.[1] The Select Commission on Immigration and Refugee Policy was created by Congress in 1978 and given 2 years to develop an immigration remedy. Its March 1981 report contains 67 recommendations designed to reassert control over immigration.[2]

Apparently, despite our immigrant heritage, Americans are opposed to more large-scale immigration. The Roper poll of June 1980 found that 91 percent of Americans support an "all-out effort" to stop illegal immigration and 80 percent want to reduce the number of legal immigrants and refugees. However, the commission believes that more legal immigrants could be admitted if illegal immigration were stopped. Its major recommendation was that the United States "close the back door to undocumented and illegal migration [and open] the front door a little more to accommodate legal migration."

In a world of nation-states, all countries must make three immigration decisions: (1) how many immigrants to admit; (2) from where; and (3) in what status. All sovereign nations claim the right to control their borders, making immigration a privilege extended to a few individuals, not a basic human right available to all. Most countries severely limit the settler immigration characteristic of the American past. More than half of the 1 million or so "settler immigrants" admitted to the world's 164 nations each year come to the United States. Unlike most nations, the United States treats all countries equally when issuing visas under the 6-tier preference system that governs the admission of our 270,000 planned immigrants. Also unique is our reluctance to separate the right to work from the right to continued residence. The United States has only 30,000 legal temporary workers, persons expected to leave when their seasonal jobs end. In contrast, European nations have used temporary alien workers for 5 to 10 percent of their work forces.[3]

Philip L. Martin, associate professor of agricultural economics at the University of California, Davis, served as an adviser to the Select Commission on Immigration and Refugee Policy.

The commission's 453-page report is a moderate response to restrictionist pressures. If its proposals were adopted, total immigration would decrease, but the legal share would rise. The report recommends more enforcement, amnesty for illegal aliens now in the United States, a 67-percent increase in quota (planned) immigrants for 5 years, no upper limit on total immigration (quota admissions, exempt relatives, and refugees), and a new international approach to vexing refugee problems.

The thrust of the report is the need for enforcement to reassert control over immigration. The commission voted 14–2 to recommend fining employers who knowingly hire illegal aliens and narrowly (8–7) recommended a "more reliable" mechanism to identify persons authorized to work (such as a counterfeit-proof social security card). By 14 to 1 it advocated increased enforcement of existing labor standards laws. Adoption of the enforcement recommendations would presumably help curb illegal immigration. But what about the 4 to 6 million persons currently living in the United States illegally? The commission recommends a onetime amnesty that would permit aliens in the United States before January 1, 1980, to become legal immigrants after the new enforcement mechanisms become active. Congress would decide the details of the amnesty program.

The commission recommended (14–2) against a large-scale, temporary worker program that might help curb future illegal immigration. By the same margin, it suggested that the small (but numerically unrestricted) H–2 program, which admits aliens for temporary jobs, be continued, but argued that employers should be weaned from dependence on such workers.

The commission's recommendations range from a call for "better understanding of international migration" to a "visa waiver for tourists and business travelers from selected countries." A quick review of immigration law and the commission's responsibilities will help put the proposals in context. The best way to outline the recommendations is to discuss their impacts on the three major groups of immigrants: legal, illegal or undocumented, and refugee.

Background

The Select Commission on Immigration and Refugee Policy was established by Public Law 95–412 on October 5, 1978, "to study and evaluate . . . existing laws, policies, and procedures governing the admission of immigrants and refugees." It was asked specifically "to conduct a study and analysis of the effects of immigration on (1) social, economic, and political conditions in the United States; (2) demographic trends; and (3) present and projected [domestic] unemployment."

The commission was established after Congress, in the early 1970's, repeatedly failed to approve sanctions on employers who knowingly hired illegal aliens; after both Presidents Ford and Carter organized interagency task forces to study immigration issues; and after President Carter's August 1977 enforcement and amnesty proposals to curb illegal immigration died in Congress. The commission's members knew that most immigration reform proposals do not survive the crossfire of opposition from special interest groups.

The commission faced the task of recommending reforms in current immigration law, which is humanitarian in spirit (favoring the admission of refugees and relatives of U.S. residents), but which is also increasingly utilitarian in practice, because illegal immigration delivers large numbers of alien workers to American employers. The 16 commissioners included four Cabinet secretaries (Justice, Health and Human Services, Labor, and State); eight members of Congress; and four representatives of the public at large. The commission's chairman was the Reverend Theodore Hesburgh of Notre Dame University.

Reforming immigration policy is never easy. Despite an immigrant heritage and the belief that the United States has always welcomed the world's tired and poor, past immigration policy actually discouraged the entry of aliens. Immigration law grew out of an ever lengthening list of excluded "undesirables" in the 1880's—first prostitutes and convicts, then Chinese, lunatics, and idiots, and in 1885, contract laborers. Current immigration law excludes more than 30 classes of "undesirable aliens," including homosexuals and security risks. The commission's predecessor, the 1907 Immigration Commission, headed by Senator William Dillingham,[4] demanded the first quantitative restrictions.[5] The 1921 Quota Act limited immigration from any country to 3 percent of the foreign-born persons from that country living in the United States in 1910. In 1924, the National Origins Law set an annual quota for each country, of 2 percent of a nationality's U.S. residents, and restricted total annual immigration to 150,000. Western hemisphere nations, including Mexico, were exempt from the quota.

In 1952, the current Immigration and Nationality Act (INA) was enacted over President Truman's veto. The INA reaffirmed national origins quotas. Amendments in 1965 eliminated the quotas and established a 7–tier system of family and skill preferences in order to rank would-be immigrants from each country. These amendments strengthened provisions that protect American workers from the competition of aliens. Needed immigrants had to show that American workers were not available to fill vacant jobs and that their employment would not adversely affect U.S. wages and working conditions.

The 1965 amendments replaced national origins quotas with a 20,000-per-country limit on quota immigrants from Eastern Hemisphere nations. Those nations, combined, could send 170,000 immigrants to the United States annually; Western Hemisphere nations were given 120,000 immigrant slots, but no country limits or preference system were imposed. In 1976, the INA was amended to extend the preference system and 20,000-per-country limit to the Western Hemisphere, and in 1978, hemisphere quotas were replaced by a single worldwide quota of 290,000. The 1980 Refugee Act put seventh preference refugees under a separate 50,000-person ceiling but left 270,000 slots for relatives and needed workers.

The research issue

The commissioners were divided on whether to conduct more research or whether the first priority was to build a consensus based on past research and reform proposals. This failure to agree resulted in simultaneous research, public hearings, and public relations strategies. Research included 22 studies of the economic and social progress of recently arrived immigrants and refugees, and a series of 24 consultations with experts, concerning topics ranging from illegal immigration to refugee issues. Public hearings were held in 12 cities across the country and attracted 700 witnesses. As a matter of public relations the commission attempted to confer with a variety of special interest groups.

Many felt that the commission should not make unpopular control and enforcement recommendations until it could quantify the benefits and costs of current migration patterns. A few commissioners wanted to begin a multiyear, longitudinal study of legal immigrants, because research on illegal aliens did not promise precise results.[6] However, the majority stressed that research must focus on the impacts of illegal aliens and seek answers to relevant questions, even if it were difficult.[7] The result was a standoff and no new substantive research. The commission's research and public hearings thus yielded a 916-page staff report and nine appendix volumes which do not expand the information base significantly. Instead, the report presents a general review of the evolution of immigration law, an overview of current problems, and analyses of the experiences of particular immigrant groups.

What kind of research on illegal aliens would have been most useful? Three basic research strategies are available. First, legal immigrants can be studied and the results extrapolated to the illegal population. For example, the economic progress of Mexican immigrants can be studied, under the assumption that illegal entrants of the same educational attainment and age, and in the same location, are making similar progress despite their undocumented status. This extrapolation strategy promises estimates of unknown accuracy. Second, illegal aliens who worked in the United States can be interviewed after they return to their home countries, where they can talk freely about their experiences. These "sending country" samples have an acknowledged bias—they include only aliens who returned. Another problem is that such studies say far more about individuals than about the impact of aliens on U.S. labor markets. A third research strategy would be to study both apprehended and unapprehended illegal aliens within selected localities, so that data from different localities may be compared. Several commissioners endorsed the idea of local area studies to determine socioeconomic impacts in cities known to contain large numbers of aliens, such as Houston, Los Angeles, and New York. These studies could examine the structure and growth of local industries, changes in local work forces, and labor market indicators such as wage levels and dispersion, hiring and turnover patterns, and unionization.

In addition to local area studies, many academicians urged a replication of the 1975 David North and Marion Houstoun study of apprehended aliens.[8] Those urging such a study believed that a large sample of aliens would show the "maturation" of illegal aliens—more women, more from urban areas, and more nonfarm workers. A stratified sample would permit researchers to isolate aliens caught before finding jobs, those apprehended after working at least 2 weeks, and those in the United States for at least 2 years.

Apprehension identifies persons here illegally. However, the problem with studies based on apprehension statistics is that persons caught and deported may not be representative of the entire illegal alien population. If that population is considered to be a room of unknown size and shape, then the apprehended alien sample is a window of known dimensions that permits a look into the room. However, it is not possible to determine whether a particular window (or sample) is a peephole or picture window. If a series of apprehended alien studies leads to uniform conclusions on characteristics and impacts, it may be assumed that the underlying phenomenon is similar among urban areas.

Immigration research will always be controversial. Scientific inquiry requires theory, data, and hypothesis testing, but there is no theory that tells us how fast the population should increase. Immigration data are scanty and unreliable. More research cannot answer specific questions precisely, such as how much will gross national product, unemployment, and average hourly earnings change if 1 million additional immigrants were admitted. But it can document trends and permit qualitative answers to questions of interest—what impacts will current migration patterns have and how do the effects of immigration vary with local conditions? Immigration reform decisions will require value judgments, but these can be informed by research.

Legal immigration

The Immigration and Nationality Act anticipates the arrival of 270,000 quota immigrants each year. Each aspiring immigrant must clear three hurdles. First, the immigrant must qualify under one of the six preferences. Second, there must be a preference quota slot available, such as the 54,000 openings for unmarried adult sons and daughters of U.S. citizens, or the 27,000 slots available to immigrants of exceptional ability and their dependents. Finally, one of the sending country's 20,000 quota slots must be available to the applicant.[9]

The commission recommends that the system of nation and preference quotas be retained but that the worldwide quota be raised to 350,000. This increase "can advance U.S. interests without harming U.S. workers." The 350,000 quota would separate immigrants into two distinct channels. One group would continue the tradition of family unification, and some unspecified percentage of the 350,000 quota would be assigned to each family unification category. The second channel would admit independent immigrants—aliens with no qualifying family ties but with exceptional ability or money to invest in the United States. The commission could not agree whether these "new seed" immigrants should be admitted only if they have job offers from American employers and will not affect U.S. workers adversely (7 votes), or if they should be admitted without an individual test unless the Secretary of Labor has declared that their admission adversely affects U.S. workers (7 votes). It also failed to agree if the 54,000 slots now available to "needed permanent workers" should be increased in number, or decreased.

Current law exempts parents, spouses, and minor children of adult U.S. citizens from all quotas. In most years, 100,000 to 150,000 quota-exempt immigrants are admitted. The commission recommended quota exemptions for unmarried adult sons and daughters of adult U.S. citizens (14–2), grandparents of adult U.S. citizens (13–3), and brothers and sisters of adult U.S. citizens (9–7). These additional exemptions and the naturalization of recent immigrants and refugees could increase the annual exempt flow of immigrants to 200,000 or more.

Would-be immigrants from some countries face waiting lists of 5 years or more, which encourages illegal entry. To reduce these waiting lists, the commission recommended (12–4) that for 5 years, an additional 100,000 slots be added to the new 350,000 worldwide quota, increasing quota immigration 67 percent. If all these recommendations were adopted, permanent or "settler" immigration could average 650,000 annually for the first 5 years and 550,000 each year thereafter, but this total would not be a firm ceiling. Despite strong pleas from environmental protection and population control groups, only one commissioner voted to impose an absolute ceiling on immigrant admissions.

Refugees

Refugee policy was changed by the Refugee Act of 1980, which permits admission of 50,000 refugees annually. However, the actual refugee quota is determined each year by the President, in consultation with Congress. In fiscal year 1981, the refugee quota was 217,000, and in 1982, it is 173,000.

The act brought the American definition of "refugee" into conformity with the United Nations standard. Until 1980, the United States defined refugees as persons fleeing communist countries, communist-dominated areas, or any country in the Middle East. A refugee is any person outside his or her country of nationality or normal residence who is unable or unwilling to return "because of a well-founded fear of persecution on account of race, religion, nationality, membership in a particular social group, or political opinion."

The commission recommended, by a vote of 11 to 3, that the President, in consultation with Congress, continue to set an annual refugee quota that considers both geographic and individual factors. The dissenting commissioners argued that 1980 presidential consultations with Congress were only *pro forma*. Because three "emergency admissions" occurred for every "planned" refugee, they believe that in actuality the President controls refugee admissions virtually unchallenged.

The Refugee Act of 1980 was in force when Cuban "boat people" arrived in southern Florida during the summer of 1980. By the end of the year, 125,000 Cubans and 15,000 Haitians had come to the United States illegally and had sought political asylum.

Most of the Cubans were resettled with friends or relatives in the United States. However, the private boats transporting the refugees were forced to accommodate an estimated 24,000 expelled "criminals." Many of these persons had committed only political offenses, but at least 3,500 were common criminals who are now in jail or at a detention center in Fort Chaffee, Arkansas.

The United States had never before received waves of persons seeking mass asylum. The Administration did not permit the Cubans and Haitians to claim refugee status immediately, lest it appear that the United States would "reward" illegal entry or accept "pushouts" of criminal elements by foreign governments in the future, and because officially defined refugees are entitled to Federally-paid welfare, health, and training assistance for up to 3 years. Instead of being given refugee status, the Cubans and Haitians were made "special entrants" with indefinite parole status, and are eligible for half of normal refugee benefits.

Pushouts and mass asylum requests figured prominently in the commission's deliberations. The commissioners recommended 12-3 to "deter the illegal migration of those who are not likely to meet the criteria for acceptance." They urged that requests for asylum be individually and expeditiously processed and that the United States "not hesitate to deport those persons who come to U.S. shores—even when they come in large numbers—who do not meet the established criteria." To expedite these deportation reviews, the commission recommended, 13-1, the development of "group profiles" to determine probable eligibility for asylum, even though each individual would still be required to prove his or her own eligibility. To ensure fair treatment of all who claim refugee status in the future, it was proposed that an interagency body be established, to make contingency plans that deal more systematically with future pushouts and mass asylum requests.

Once in the United States, refugees must be resettled and integrated into society. Since 1975, nearly 1 million refugees have been accepted, half from Indochina. Traditionally, the Federal Government admits refugees, and voluntary associations (especially church groups) resettle them in conjunction with State and local governments. The expansion of social welfare programs, the large number of refugees, and the tendency of refugees to cluster in a few areas have encouraged the Federal Government to step up its refugee assistance efforts. The Refugee Act of 1980 allows the Federal Government to reimburse voluntary agencies for the costs of resettling refugees, $525 for each Indochinese refugee and $365 for each European, African, and Middle Eastern refugee.

The commission recommended (11-3) that State and local governments help plan for refugee resettlement and that Federal "impact aid" be considered for communities with concentrations of refugees. Federal policies now attempt (unsuccessfully) to disperse refugees. But the commission suggested that refugees be encouraged to cluster in particular areas because (1) they will anyway; (2) more experienced refugees can ease the integration of newcomers; and (3) it is less expensive to provide special education and training assistance to concentrations of refugees. It also recommended that refugee resettlement be geared to the achievement of self-sufficiency, and that cash assistance be terminated for refugees "who refuse appropriate job offers."[10]

Clustering refugees concentrates their economic benefits and costs. If refugees help revive declining neighborhoods and keep mobile industries from leaving an area, local economies benefit. If, on the other hand, unskilled refugees compete with disadvantaged residents for jobs and require costly education and social services, local economies suffer. No conclusive evidence is available to demonstrate that communities are generally either helped or hurt by an infusion of refugees.

Illegal immigration

The study of illegal immigration was the commission's principal purpose and the issue that defied resolution. The commission's sounding of public opinion found that most U.S. citizens want to close the half-open door of undocumented and illegal migration.

The number of illegal aliens in the United States is unknown. Partial evidence for the belief that an "uncontrolled hemorrhage of people" is flooding into the country comes from statistics on apprehended aliens. Since 1970, the Immigration and Naturalization Service (INS) has apprehended more than 8 million persons illegally in the United States (table 1). Today, most aliens are caught away from the worksite, and the decline in the percentage of workers among apprehended aliens in data for the 1970's reflects INS de-emphasis of worksite inspections, rather than a true increase in the proportion of jobless aliens. INS worksite inspections were halted on March 31, 1980 to encourage illegal aliens to participate in the decennial census. According to table 1, industrial worker apprehensions outnumbered farmworker apprehensions in 10 of the last 11 years.

Table 1. Illegal aliens apprehended in the United States, by type of employment, fiscal years 1970-80

Fiscal year	Agricultural			Industrial and other			Totals		
	Border patrol	Internal investigation	Total	Border patrol	Internal investigation	Total	Total workers	Total apprehensions	Workers as percent of apprehendees
1970	51,655	4,254	55,909	12,928	60,844	73,772	129,681	324,444	40.0
1971	73,399	5,314	78,713	13,924	62,145	76,069	154,782	397,517	38.9
1972	80,922	4,873	85,795	18,339	79,869	98,208	184,003	478,706	38.4
1973	99,384	6,342	105,726	23,547	102,370	125,917	231,643	647,512	35.8
1974	112,107	4,964	117,071	24,472	99,833	124,305	241,376	780,991	30.9
1975	110,184	4,742	114,926	26,797	108,665	135,462	250,388	756,819	33.1
1976	116,735	6,085	122,820	25,531	110,734	136,265	259,085	866,433	29.9
1977	94,665	14,381	109,046	24,763	114,528	139,291	248,337	1,033,427	24.0
1978	95,021	12,551	107,572	38,812	87,019	125,831	233,403	1,047,687	22.3

The commission reviewed the research on numbers and characteristics of illegal aliens and discovered five "common findings":

- A review of "other studies" led the Census Bureau to estimate that in 1978, 3.5 million to 5 million aliens may have been in the country illegally. Less than half were Mexican.
- Young single males are most likely to attempt to cross borders without inspection. Characteristics of persons using false documents or violating terms of their legal entry are more diverse.
- Almost all illegals are attracted by U.S. jobs that pay relatively high wages, often 5 to 10 times the earnings the alien could expect at home.
- Most illegal aliens earn at least the minimum wage. Many earn up to $6 or $7 per hour.
- There is no meaningful "average length of stay" in the United States. Some illegals do seasonal agricultural and construction work and leave the United States for 2 or 3 months each year. However, a growing proportion are expected to settle permanently, a trend anticipated by experience with migrant labor in other countries.

The commission also reviewed the impacts of illegal aliens on wages and unemployment, social service costs, and the "overall effect on U.S. society," finding almost "no consensus" among researchers. For example, the commissioners noted that opinions on job displacement range from zero (no displacement) to one (every illegal alien displaces one American). Similarly, the commission reported that some economists believe the presence of unskilled illegals increases the wages of skilled workers but depresses the wages offered to young and unskilled Americans. The commission's report adopted a middle position on both issues, arguing that illegals depress wages and increase unemployment to an unknown extent.

The commission took a firmer stance on the social service impacts of illegals, agreeing with persons who maintain that "illegal aliens do not place a substantial burden on social services." It sided with those who argue that illegals have payroll taxes deducted from their paychecks, but that for fear of being apprehended, illegals avoid the social service agencies that provide corresponding benefits. David North's tabulation of tax-based benefits received data from 10 studies supports the commission's position. However, his own 1981 study of 580 aliens found that half of the 147 illegals who qualified for unemployment insurance in California sought benefits, and 35 percent collected.[11]

The commission believes that illegal immigration must be curbed because "illegality breeds illegality." Mexican and American "coyotes" smuggle aliens across the border in a business so profitable "it rivals the smuggling of narcotics," but carries a much lower probability of apprehension and punishment.[12] A smuggling ring can transport 500 aliens weekly and charge each person $500, generating $12 million annually. In 1979, the INS arrested 18,500 such smugglers. But only a third of the 6,000 prosecuted were convicted.

Aliens illegally present are returned if apprehended. However, in 38 States it is not a crime to knowingly hire an illegal alien.[13] They, like other workers, are protected by labor standards laws. Aliens, whether aware of their rights or victims of systems they do not understand, generally do not complain when employers break wage and working condition laws. This is true regardless of the educational level of aliens, as most know that employers can easily report them to the INS. The alien who knows he should be paid $3.35 hourly instead of only $3 knows that the extra 35 cents over 1,000 work hours is $350. However, if a complaint leads to apprehension, the alien worker loses wages, may pay $300 to $400 in smuggling fees to get back into the United States, and must then find another job. Because of the border patrol's partial enforcement (which encourages the smuggling business) and because employers suffer no penalties for hiring illegal aliens, a system that delivers docile aliens to U.S. employers is maintained. The commission believes that this cycle of lawbreaking is illegal immigration's most pernicious impact, breeding disregard for all U.S. law.

Would a "guestworker program" curb pressures to enter the U.S. illegally? The commission "carefully weighed" the arguments for and against guestworkers, and recommended (14–2) against the introduction of a large-scale temporary worker program. Moreover, the commission recommended (14–2) to "streamline" the current H–2 program that admits temporary alien workers for temporary U.S. jobs. It suggested that the Department of Labor speed the certification process and that employers of H–2's be required to forward to the U.S. Treasury the payroll taxes they now withhold. Although the commission wants to end the dependence of any industry on a constant supply of H–2 workers, it is aware of the benefits of a slight expansion of the program.

Instead of guestworkers, the commission recommends enforcement to keep out illegal entrants, but amnesty for persons illegally in the United States before January 1, 1980. The enforcement package would include "better border and interior controls" and "economic deterrents in the workplace," such as more and better-trained border patrol officers and equipment, crackdowns on alien smugglers and visa abusers, civil and possibly criminal penalties for employers who knowingly hire illegal aliens (14–2), the development of a "more reliable" mechanism to separate legal workers from illegal aliens (8–7), and increased enforcement of wage and working conditions laws. After these enforcement measures are in place, the commission recommends a one-time amnesty program that would permit illegal aliens to request immigrant status. The details of the amnesty program are the preserve of Congress, but the commission estimates that 2.7 million persons may qualify if all undocumented aliens in the United States for at least 2 years have their status legalized.

Will border enforcement, employer sanctions, and identification cards stop illegal immigration? No one can give an unequivocal answer. Most immigration specialists believe that this three-pronged enforcement strategy will sharply reduce illegal immigration. Only 350 officers patrol the 2,000-mile Mexican border, one for every six miles. But most of the Mexican border is "self-policing" desert—60 percent of all apprehensions are made along 60 miles of border—the lower Rio Grande Valley, and around El Paso, Texas and Chula Vista, California. Similarly, fines and identification may not stop the hiring of illegal aliens, but penalties of $500 to $1,000 per illegal hire would reduce economic incentives that now make some employers prefer aliens. Immigration enforcement will never be completely successful. The policy question is what level of failure the United States is willing to tolerate.

Conclusions

Immigrants are responsible for about half of today's net population growth. If the commission's immigration and enforcement recommendations were accepted and net illegal immigration were reduced to 100,000 annually, the population would increase from 227 million today to a peak of 281 million in the year 2025. By 2030, more than 12 percent of the American population will be immigrants themselves, or descended from immigrants who arrived after 1980. If legal immigration is increased but enforcement efforts fail, permitting net annual illegal immigration of 500,000, the population would be 306 million by 2035. Post-1980 immigrants and their descendents would be 20 percent of the expanded population.

Immigration is an important component of population growth, and proposals to control it are subjected to a benefit-cost analysis. Many items, such as employer sanctions and identification cards, run counter to American tradition, and debate shifts from a particular immigration item to discussions of the unknown effects of current arrangements. The result is policy stagnation. There is widespread feeling that "something must be done" but no consensus on what to do. The employers benefiting from large-scale immigration fight to keep their cheap labor. Americans who lose are unable to quantify the impact of immigrants on their own economic well-being or organize to present their complaints.

Immigration reform is a social issue that generates tension but defies an easy solution. Tension is reflected in the psychological feeling that the United States should curb immigration in an era of limits. The reality is that immigration is at an alltime high. If the United States cannot grope its way toward a consensus, it risks extreme, probably restrictionist action.[14] □

Another look at the link between work injuries and job experience

FRED SISKIND

In a recent article in the *Review*, Norman Root and Michael Hoefer investigated the relationship between duration of employment and worker injuries and illnesses.[1] Their analysis of 1976 and 1977 workers' compensation data for 10 States from the Bureau's Supplementary Data System (SDS) led them to conclude that "more workers are injured in the first month and year of service than any other month or year . . ."[2]

However, Root and Hoefer were unable to calculate injury incidence rates by employment duration to determine whether certain tenure groups experience disproportionately high numbers of injuries. Constructing such statistics would involve dividing the number of injuries by the total exposed population for each group. While the numerators for incidence rates—numbers of injuries by employment duration—are available from the SDS, the appropriate denominators—total numbers of injured and uninjured workers by tenure group—are more difficult to estimate.

The following analysis uses a ratio index approach to gauge the relative injury experience of workers by duration of employment.[3] Injury and employment duration information from the SDS is linked with work experience data for the general working population from the 1977 Quality of Employment Survey and the January 1978 Current Population Survey. As we will see, the results suggest that workers would generally be subject to disproportionately high injury rates during their first few months and years on the job.

Data sources

The *Supplementary Data System* gathers detailed injury and illness information from the workers' compensation system in each cooperating State[4] Data from 1977 and 1978 are used for this analysis. The 1977 information covers 540,000 cases in the 12 jurisdictions which reported employment duration information to the Bureau for that year: California, Colorado, Idaho, Indiana, Iowa, Kentucky, Maine, Maryland, New Mexico, South Dakota, the Virgin Islands, and Wyoming. Data for 1978 pertain to 705,440 injury and illness cases from 16 jurisdictions—Alaska, Hawaii, Montana, and Utah, in addition to those listed above.

Records of injuries and illnesses in such a small number of jurisdictions are not necessarily representative of nationwide experience. However, the 1977 data are from jurisdictions accounting for 21 percent of U.S. employment, and 1978 information covers 23 percent.

The *1977 Quality of Employment Survey* (QES) was conducted by the Survey Research Center of the University of Michigan under contract to the Department of Labor. During October-December 1977, a representative sample of 1,515 employed persons age 16 or older and currently employed 20 hours or more per week were interviewed concerning their work experiences. Two questions were asked regarding job tenure:

- "For how many years or months altogether have you worked for your present employer?"
- "For about how long altogether have you had your present job (with this employer)?"

Table 1. Relative injury experience by duration of employment, 1977

Employment duration	Percent distribution of			Incidence ratio 1 (1)/(2)	Incidence ratio 2 (1)/(3)
	Injury and illness cases[1] (1)	Wage and salary workers[2] (2)	All workers[3]		
1 to 3 months	20.8	11.3	14.0	1.84	1.49
4 to 12 months	22.9	16.0	18.1	1.43	1.27
2 to 3 years	20.4	19.6	21.8	1.04	.94
4 to 5 years	11.0	11.1	12.0	.99	.92
6 to 10 years	12.8	16.8	15.8	.76	.81
11 or more years	12.0	25.1	18.2	.48	.66

[1] Data are from unpublished SDS tables for 12 jurisdictions, and relate to workers age 16 and over by duration of employment.

[2] Data are from the *1977 Quality of Employment Survey* (Ann Arbor, Mich., The University of Michigan, 1979), table 9.3. They relate to workers age 16 and over by duration of employment with present employer.

[3] Data are from the *1977 Quality of Employment Survey*, table 9.5, and relate to workers age 16 and over by duration of employment in present job.

Fred Siskind is a labor economist in the Office of the Assistant Secretary for Policy, Evaluation and Research, U.S. Department of Labor.

Table 2. Relative injury experience by duration of employment, 1978

Employment duration	Percent distribution of— Injury and illness cases[1] (1)	All workers[2] (2)	Incidence ratio (1)/(2)
1 to 3 months	20.1	11.6	1.73
4 to 6 months	10.6	9.0	1.18
7 to 12 months	14.4	9.8	1.47
2 to 3 years	20.9	20.7	1.01
4 to 5 years	9.9	12.3	.80
6 to 10 years	12.5	15.7	.80
11 to 25 years	9.9	16.0	.61
25 to 35 years	1.4	3.9	.36
36 or more years	2	1.1	.18

[1] Data are from unpublished SDS tables for 16 jurisdictions, and relate to workers age 16 and over.

[2] Data are from unpublished tables for the January 1978 CPS, and relate to all workers age 16 and over, and cover the same jurisdictions except the Virgin Islands.

The first question was asked of wage and salary workers. The second was asked of all workers, with the phrase in parentheses omitted for the self-employed.[5]

The *Current Population Survey* (CPS) is a monthly survey of 65,000 households which provides comprehensive labor force data. A supplement to the January 1978 CPS asked respondents for 56,000 households to specify the date on which each employed household member started working at his or her present job or business. Duration data calculated from the responses to that question, and a description of the sample design and estimating methods, have been published in a BLS Special Labor Force Report.[6]

Results of the ratio index analysis

Table 1 presents the percentage distribution of injury and illness cases by duration of employment from 1977 SDS data (column 1), and the distribution of workers by duration of employment from the QES survey (column 2 in terms of duration with current employer, and column 3 by duration in current job). Columns 4 and 5 present the ratios of the injury and illness percentages in column 1 to the overall employment duration percentages in columns 2 and 3, respectively. A ratio greater than 1 indicates that the percentage of injuries for workers in the particular duration group (for example, 1 to 3 months) is higher than the percentage of employment accounted for by the same group. A ratio below 1 indicates the opposite.

Whether employment duration is measured as time with present employer or time in current job, the data show a steady decline in risk as employment duration increases. First-year workers incur more than their share of injuries while those with more than 5 years on the job experience a disproportionately low number of injuries. But while the results support our expectations, they are limited in scope and should be interpreted with caution. The injury and work duration data from the SDS cover only 12 jurisdictions in 1977 and 16 jurisdictions in 1978, while the employment duration data from the QES reflect nationwide experience. And, QES data do not permit analysis of injury experience for different age and sex groups.

The limitations listed above can be overcome by using employment duration data from the CPS. These data are based on a much larger sample than the QES results, and are available for the separate jurisdictions (except the Virgin Islands). Table 2 thus provides information, comparable to that in table 1, which is limited to the jurisdictions which submitted injury data for 1978 to

Table 3. Relative injury experience by employment duration, sex, and age, 1978

Sex and age of worker	Employment duration: 1 to 3 months	4 to 6 months	7 to 12 months	2 to 3 years	4 to 5 years	6 to 10 years	11 to 25 years	26 to 35 years	36 years and over
Men

Age 55 to 64	1.23	1.17	1.27	1.06	1.07	.91	1.01	.78	.43
Age 65 and over	.72	1.33	.96	1.34	.75	1.60	1.23	.50	.14

NOTE: Numerators for the ratios are data from unpublished SDS tables for 16 jurisdictions. Denominators are unpublished CPS data for January 1978 for the same jurisdictions, except the Virgin Islands.

the SDS. The ratio calculation results are generally similar to those shown in table 1. First-year workers experience more than their share of injuries while those with 4 or more years on the job incur a disproportionately low number of injuries. However, the decline in injury experience as job duration increases is not as smooth as that shown in table 1; for example, the 4-to-6-month ratio is below that for 7- to 12-months' tenure.

Table 3 presents ratios for detailed age categories by sex. Within most age categories, workers are more likely to experience an injury during their first few months or years on the job than after longer periods. However, for a few age groups—women 45 to 54, and both men and women 65 and over—a clear decline with tenure does not seem to prevail. Another interesting finding is that the disproportionately higher share of injuries experienced in the first 3 months, and generally the first year, in a new job is more marked for men than for women, particularly in the higher age categories. One possible explanation for this finding is the different industry and occupational mix for men and women. Men may work disproportionately in those industries and occupations where injuries are more common in the first few months on the job.[7]

THE FOREGOING ANALYSIS indicates that workers would generally experience disproportionately high injury rates during their first year on a new job or working for a new employer. The data for men and women by detailed age categories support this observation. Almost all age and sex groups have disproportionately high injury experiences during their first few months and first full year on a new job.

These findings are further evidence that special efforts should be made to assure that new employees and employees changing jobs are aware of good safety practices in the workplace. The Federal Mine Safety and Health Amendments Act of 1977 requires such safety training for miners. Similar efforts may be beneficial in many other industries. ☐

Special Labor Force Reports–Summaries

More than half of all children have working mothers

ALLYSON SHERMAN GROSSMAN

More children than ever before have mothers who are in the labor force. In March 1981, 31.8 million youngsters below age 18—54 percent of the Nation's total—had mothers who were either employed or looking for work. (See table 1.) Since 1970, the number of children with working mothers has grown by 6.2 million despite a 6.6-million decline in the children's population.[1]

By March 1981, a record 8.2 million children below age 6—45 percent of all preschoolers—had working mothers. A year earlier, these figures were 7.7 million or 43 percent. Two major factors accounted for this growth. First, the long-term increase in labor force activity among mothers below age 35 accelerated over the year. Their participation rate advanced by more than 2 percentage points, to reach 49 percent. Second, as the number of births among these women increased,[2] the population below age 6 grew by nearly 400,000. At the same time, the population of school-age children (6-to-17-year-olds) dropped substantially over the year, and the number of these children with working mothers also declined. Thus, preschoolers accounted for all of the year's net increase in the number of children with working mothers.

More young mothers working

Reflected in these patterns are the changing work and marital profiles of women born during the post-World War II baby boom. For instance, between March 1980 and March 1981, the number of working mothers increased by 600,000 to reach 18.4 million, and those with children below age 6 were responsible for 60 percent of the gain. Within this group, women between the ages of 25 and 34 registered the greatest increases. These women have generally been showing a propensity to delay marriage, postpone childbearing, and ultimately to have fewer children than women of comparable ages in the past. As a result, many of those who eventually become mothers have spent more years in the labor force than many of their predecessors, and they often choose to remain in the work force or return to it soon after childbearing. In contrast, the early marriage and prolific childbearing patterns of a generation ago resulted in the almost automatic and prolonged withdrawal of young mothers from the labor force.[3]

Because of these trends, the traditional concept of a family with the father as the only earner has changed dramatically. For example, both parents were earners in about 60 percent of all married-couple families with children under 18 years in 1981. (See table 2.) On average, these dual-earner families were smaller than comparable single-earner families. Fewer than 6 of 10 had more than one child, compared with nearly 7 of 10 of the one-earner families. Among families maintained by women, the presence of earners was affected by the number of children. For instance, of families with children, 65 percent of those without earners had more than one child compared with less than half of those with earners.

Other sociological changes of the 1970's also contributed to the growing number of children with working mothers. Two of these were the increase in the divorce rate and the growing occurrence of unwed mothers. In 1981, 11.6 million youngsters—1 of every 5—were living with their mother or their father only. This was almost 60 percent more than in 1970, when 1 of every 9 youngsters lived with only one parent. Most lived with their mothers; however, small increases have been posted in the number of children living only with their father. Black children were far more likely than white children to be living with one parent (50 percent of black children, compared with 15 percent of white children).

Despite the recent surge into the labor force of mothers with younger children, older children remain more likely than younger ones to have working mothers. For example, of all children between the ages of 14 through 17 who lived in two-parent families in March 1981, 60 percent had mothers in the labor force, compared with 56 percent of the 6-to-13-year-olds and 45 percent of

[1] Children are defined as "own" children of the family. Included are never-married daughters, sons, stepchildren and adopted children. Excluded are other related children such as grandchildren, nieces, nephews, cousins, and unrelated children.

[2] Includes only divorced, separated, widowed, or never-married persons.

NOTE: Due to rounding, sums of individual items may not equal totals.

the children under 6. Among children living with their mother only, the proportion whose mothers worked was two-thirds for those between the ages of 6 and 17 and one-half for those below age 6. (See table 3.)

Socioeconomic characteristics

Proportionately more black (59 percent) than white children (53 percent) had working mothers in 1981. This difference has been narrowing in recent years as white mothers have joined the work force at a faster pace than black mothers. Nevertheless, at every age level, black children in 2-parent families were still more likely than white children to have a working mother. In one-parent families, however, the situation was reversed; a larger share of white than black children had a working mother. Hispanic children were less apt than either white or black children to have working mothers.

Table 2. Families by presence and number of children under 18, number and relationship of earners in 1980, and family type, March 1981

[1] Children are defined as "own" children of the family. Included are never-married daughters, sons, stepchildren, and adopted children. Excluded are other related children such as grandchildren, nieces, nephews, cousins, and unrelated children.

[2] Includes only divorced, separated, widowed, or never-married persons.

NOTE: Due to rounding, sums of individual items may not equal totals.

Regardless of race, ethnic origin, or family type, children with a working mother were in families with considerably higher incomes, on average, than were children whose mother was out of the labor force. The median income in 1980 for all two-parent families with children was $26,500 when the mother worked and $21,300 when she did not.

Generally, white children live in families with higher incomes than black children. Family income for white, two-parent families with children averaged $26,900 when the mother was in the labor force and $21,700, when she was not. Comparable median incomes for black families were $23,000 when the mother worked and $14,900 when she did not. (See table 4.)

For some mothers, work is a necessity. It provides economic benefits that may constitute a major share of their offspring's support. In March 1981, one-fourth of all children—14.8 million in all—were living in families in which their father was absent (10.5 million), unemployed (2.4 million), or out of the labor force (1.9 million). More than half of all black children and nearly one-fifth of all white children lived in one of these circumstances. Between March 1980 and 1981, the total number of children in these situations remained steady as the increase in the number with unemployed fathers was offset by a decline in the numbers whose fathers were absent or out of the labor force. In each of these

[1] Includes only divorced, separated, widowed, or never-married persons.

[2] Children are defined as "own" children of the family. Included are never-married daughters, sons, stepchildren, and adopted children. Excluded are other related children such as grandchildren, nieces, nephews, cousins, and unrelated children.

NOTE: Due to rounding, sums of individual items may not equal totals.

About 4.6 million families with children were in poverty during 1980. About 7 percent of married couples with children were poor as were 44 percent of the families maintained by women. For both family types, the incidence of poverty increased as family size grew. ☐

FOOTNOTES

[1] Unless otherwise indicated, the data in this report are from information collected in the March supplement to the Current Population Survey conducted and tabulated for the Bureau of Labor Statistics by the Bureau of Labor Statistics by the Bureau of the Census. The data have been inflated using population weights based on results from the 1980 census of population. The March 1980 data also have been revised to bring them in line with the new population weights and to make them comparable with the March 1981 data. Previously published 1980 data reflected population weights projected forward from the 1970 Census. The effect of the revision on the 1980 data is shown in table 1, which presents the original as well as the revised estimates for 1980.

As the table shows, the number of children with working mothers in March 1980 was revised upward by 866,000. Despite this, and similarly significant changes in other data for 1980, the various relationships and percentages based on the new estimates are nearly the same as those based on the previously published estimates.

Becoming a union leader: the path to local office

KAREN S. KOZIARA, MARY I. BRADLEY,
AND DAVID A. PIERSON

Although there are many commonly held notions about why and how people become union officers, there is little empirical information about the process of becoming one, particularly at the local level. Much of what is known about local union officers comes from studies done in the 1950's and early 1960's. Although these studies focused on analyzing the functions or operations of local unions, they do provide information on their leadership.[1]

Based on prior research, there has been some preliminary theoretical work on the process of officer selection. However, the results have been used primarily to explain why women are underrepresented in union office, rather than to provide information on who becomes a union officer, and why and how they become one.[2] This paper examines more general hypotheses about the officer selection process suggested by earlier studies.

Selecting an officer

We assume that the decisions of both union members, including officers, and candidates are important in the leadership selection process, and that perceptions of members and candidates are an essential part of the decisionmaking. The significance of member perceptions and candidate self-evaluations in officer selection is that people act upon what they believe to be true, rather than reality itself.[3]

Both members, including officers, and candidates compare candidates' perceived qualifications to requirements of office. If members perceive that a candidate meets the latter, he or she can become an officer. However, if the candidate is viewed as unqualified, the candidate cannot attain office. Similarly, people do not run for office unless they think of themselves as qualified and acceptable to other members and officers, and believe the rewards of office will meet their needs.

Drawing from earlier research on union leadership, our study was designed to test several hypotheses. Two closely related ones are first, that time as a union member, and particularly that spent as an officer, results in members and candidates seeing a candidate as being sufficiently experienced to hold higher office; and second, that experience in lower office is seen as an important qualification for higher office, and may even be a prerequisite for holding top local positions.

Self-perceptions of readiness for office are likely to be enhanced by time with the union and prior experience in its administration. These will also be affected by indications from members and current officers that they perceive the candidates as qualified for office. Finally, willingness to take office requires that candidates see the rewards of office as meaningful.

Methodology used

The data used to analyze these hypotheses are from a study of the administration and structure of eight large local unions, varying in size from 1,500 to 12,000 members, in three Eastern States. Three of these locals are in the public sector and five are in the private sector. Service, professional, and industrial unions are included. Indepth interviews with each local's top officers (presidents, vice presidents, secretary-treasurers, and executive board members) were included as part of a sophisticated case study. Interviews were conducted by two-person interdisciplinary teams, each consisting of an industrial relations specialist and an organizational behavior specialist. The team approach was used to check interrater reliability and reduce probability of disciplinary-based selective perception. The results provide a rich source of qualitative and quantitative information about union leadership and administration.

Who were the respondents?

Thirty-eight elected union officers were interviewed and placed in one of two categories. The first consists

Pierson an assistant professor, Department of Industrial Relations and Organizational Behavior, Temple University. The research in this paper was supported by a grant from the Labor Management Services Administration, U.S. Department of Labor.

primarily of local presidents; however, in two locals an elected manager or director had the major administrative responsibility and was included in this category. It contains a total of 10 officers—8 white men, 1 black man, and 1 white woman.

The second category has 28 people, including vice presidents, secretary-treasurers, and other executive board members. It is made up of 17 whites, 10 blacks, and 1 Hispanic. There are 23 men and 5 women in this group.

Prior union administrative experience

As mentioned earlier, prior union involvement and administrative experience was hypothesized to be a prerequisite for election to top local leadership. Of the presidents responding to the question about number of previous positions, all had held some with the union prior to their current job. Six had held three previous positions; three had held two; and none had held fewer than two. The mean number of positions held beforehand was 2.66.

The respondents in the vice president category had somewhat less experience, but their responses followed a similar pattern. Three had three previous positions, eight had had two, 14 had had one, and two officers reported that their current position was their first in union administration. The mean number of prior offices was 1.44.

These responses indicate that union presidents and vice presidents usually have prior union experience before being elected to their current office, and that presidents have somewhat more experience in prior office than do vice presidents.

The respondents' prior union experience shows presidents to have spent an average of 17 years in the local, compared with 15 years for vice presidents. The presidents had spent about 15 years in administrative positions, including their current positions. This indicates that most of the presidents began their path to office relatively soon after joining a union.

The vice presidents had been members of the local an average of 15 years. They had spent an average of 9.3 years as a union officer, and 3.9 years in their current positions. This suggests that although presidents appear to become active in union administration sooner than vice presidents, involvement for both groups actually begins within 5 years of their initial membership.

The first union administrative position for most officers was shop steward (6 of 9 presidents and 22 of 27 vice presidents). Most officers who did not start as steward began with less responsible positions, such as that of trustee. In only a few cases did they have as their first position an office more responsible than shop steward. Generally, these officers had been charter members of the local, and had begun in executive board or similar positions.

In six instances, officers had begun their union careers in other locals, which subsequently merged with their current organizations, and continued in administration after the mergers. None showed a pattern of changing locals in a quest for higher administrative office.

Most officers interviewed had progressed steadily to positions of increased responsibility in the union (all presidents and 22 of 28 vice presidents). Practically none had breaks in their careers as union officers. Many reasons could be suggested for this finding; however, a pattern appears clear. People who achieve the highest elected positions in union office begin their careers early in their union tenure at entry level positions (most often shop steward) and usually have uninterrupted careers as they progress to more responsible positions. One of the implications of this finding is that when there are election challenges to incumbent leaders, they do not come from members outside the leadership hierarchy but from people already in the established network. This reinforces the idea that experience is a major variable influencing how potential candidates for office are perceived by themselves and others. It is also consistent with the explanation for the paucity of women in union office, which suggests that interrupted work careers inhibit advancement to other positions.[4]

Member and officer perceptions

One of the assumptions mentioned earlier in describing the selection of union officers is that perceptions of officers, members, and candidates are an important part of the decisionmaking process. Participants' responses as to why they became union officers are supportive of this idea. Five of the respondents in the president category were asked either by officers or union members to run for office. Similarly, 20 of 26 respondents in the vice president category reported originally running for office at the urging of either officers or members. This is consistent with the hypothesis that members and candidates both must see a candidate's qualifications for office as congruent with the demands of office. It also suggests that an important element influencing candidates' self-evaluations is the communication to them of the positive perceptions of members or officers.

Candidates' self-perceptions

In addition to the encouraging feedback from officers and other members, the union officials interviewed initially had positive self-perceptions of their ability to handle the responsibilities of union office. Eight of ten presidents indicated that they originally ran for office because they thought they had something to contribute to the union. Eighteen of twenty-six vice presidents also gave this reason. Their responses included comments such as, "I can deal with people;" "I thought I could do a good job," and "I was as good as anyone else."

Rewards of office

Another factor assumed to influence the decision to become an officer is the candidate's perception of the rewards of office. Sayles and Strauss have identified six general rewards of union office: a sense of achievement or self-fulfillment, an outlet for aggression, an intellectual outlet, relief from monotonous jobs, opportunity to gain prestige of status, and a social outlet.[5] The officers interviewed identified as most important three of these rewards, which are closely related: self-fullfillment, intellectual outlet, and relief from monotonous jobs. Many officers, 31 of 37, saw union office as an opportunity for self-fulfillment or growth that could not be gotten from their jobs. Typical responses were, "I wanted to do something more than ring a bell everyday," "I wanted control over my own destiny," and "I wanted to do something meaningful."

In contrast, the other rewards of office were mentioned much less frequently. Only three officers indicated prestige as a reason for being a union officer; five gave desire for power as a motivating factor; and none mentioned either desire for an outlet for aggression or social opportunities.

Thus, the interviews show the importance of personal growth and fulfillment in causing people to want to hold office. The form that fulfillment takes varies according to individuals, as indicated by such statements as, "I like the freedom it brings me," to, "I wanted to show that black people were people, too." However, the significance of this growth is a theme that was apparent in nearly every interview.

Commitment to unionization, while not really a reward of office, was another common theme. Thirty of thirty-seven officers gave it as a reason for either entering or continuing to hold union office. Although this indicates idealism, the commitment was often expressed in very practical terms. A typical comment was, "Because of the way management is here, we needed a good union." However, belief in unionism, as well as desire for personal growth, was important in the decision to be a union officer.

ALTHOUGH THIS PAPER is based on a limited number of observations, the officers interviewed come from a variety of occupations and their responses show consistency. The pattern indicates that people who eventually become union officers become active in union administration early in their tenure with the union. Once having become active, officers remained involved in administration. They progressed up the administrative hierarchy, reaching top level office only after experience in other positions. In general, they are people who believe unions have a meaningful function to perform in our society, and see themselves as benefiting from the opportunity for personal growth provided by holding office. Important motivators encouraging them to be active are: urging by members and officers, self-perceptions, the desire for personal growth, and a commitment to unionization. □

Developments in Industrial Relations

Early negotiations in the auto industry

With the Nation in the midst of a recession that began in midyear, and the domestic automobile industry still afflicted by a sales slump that began 2 years earlier, the United Auto Workers agreed to early negotiations with General Motors Corp. (GM), Ford Motor Co., and American Motors Corp. Early negotiations also were scheduled with International Harvester Co., which faced a possible loss of $500 million on its 1981 sales of trucks and farm equipment. Chrysler was not involved in the talks because its UAW-represented workers had agreed to wage concessions in November 1979, January 1980, and January 1981 that provided for more than a billion dollars less in compensation increases than the union's 1979 settlements with GM and Ford. The current GM and Ford (and Chrysler) agreements with the UAW expire in September 1982; the American Motors agreements expire in September 1983 (January 1983 at its Toledo, Ohio plant); and the International Harvester agreement expires in October 1982.

There was no immediate indication of whether the early negotiations might result in new multiyear contracts that would supplant the balance of existing agreements, or if any new contracts would not be effective until the expiration of the current agreements. Certainly, GM's and Ford's position was clear; they began 1981 by calling for immediate labor cost concessions to reduce a claimed $8-an-hour disparity with the Japanese auto producers. Throughout the year, the two companies intensified their drive for cost relief, citing their growing financial losses and increasing job cutbacks.

There also was no clear indication of what form any possible union concessions might take, although both GM and Ford insisted that it would not be necessary to reduce wages. Ford President Donald E. Petersen mentioned changes such as reducing the number of paid days off, tightening the requirements for medical leaves of absence, and broadening job definitions to permit more efficient utilization of employees. Earlier, he had called for a freeze on automatic cost-of-living pay adjustments. This proposal was unpopular with UAW members, who view cost-of-living adjustment clauses as a sacrosanct part of their contracts ever since they were first negotiated with GM in 1948.

GM Chairman Roger B. Smith said that a program to cut unexcused absences and increase productivity could substantially reduce operating costs. According to Smith, days off for sickness and accidents increased by 50 percent in the last 10 years and in 1980, GM lost $1 billion because of unexcused absences.

Ford and GM indicated willingness to follow the lead of Chrysler and adopt profit-sharing plans. But this approach was viewed with skepticism by many workers, who doubted that the companies could attain profitability in the near future.

An approach that was apparently more acceptable to the union as a basis for bargaining was included in an American Motors proposal made to the union in November. The proposal called for American Motors' employees to lend the company approximately $150 million, with repayment of the principal—and 10 percent interest—expected to begin in 1984. The money for the loan would be accrued by eliminating or reducing scheduled future improvements in wages and benefits.

To some extent, the UAW's decision to consider cost concessions was influenced by cuts in compensation of white-collar employees announced by Ford and GM. At Ford, the changes for 63,000 salaried employees included a loss of two vacation days in 1982; elimination of a paid holiday in December; exclusion of the cost-of-living allowance in calculation of paid time off (the allowance continued to be included in pay for time worked); and limiting overtime pay to straight-time rates for employees exempt from the requirements of the Fair Labor Standards Act.

At GM, the changes for the 138,000 white-collar employees in the United States included elimination of 8 casual days off, cuts in the vacation schedule, elimination of cost-of-living pay for paid time not worked, and increased insurance deductibles and reduced benefits. Reportedly, the company also was in the process of lay-

"Developments in Industrial Relations" is prepared by George Ruben and other members of the staff of the Division of Developments in Labor-Management Relations, Bureau of Labor Statistics, and is largely based on information from secondary sources.

ing off 13,000 employees from its worldwide staff of 190,000 white-collar workers.

The results of adverse economic conditions also were apparent in other industries, as union members generally agreed to employer requests for labor cost concessions:

- In Fort Wayne, Ind., 1,000 employees of Dana Corp.'s truck axle plant agreed to cuts in labor costs totaling $2 million a year. The revisions included a 6-month delay of a scheduled 3-percent wage increase, cancellation of a holiday bonus, and lower cost-of-living adjustments. The workers are represented by the Allied Industrial Workers.
- In the Detroit area, a scheduled shutdown of Federal Forge Inc. was averted when its 190 employees voted to give up four paid holidays and their cost-of-living adjustments. The plant produces forgings for the automobile industry. Its production workers are represented by the UAW.
- Also in the Detroit area, 150 employees of the Macomb Daily newspaper accepted a $30-a-week pay cut and elimination of their cost-of-living clause. The workers are represented by various unions
- In the trucking industry, Motor Freight Express, Inc. announced that more than two-thirds of its 1,500 employees had joined the voluntary "job rescue plan" since its inception in September 1981. Under the plan, 21 percent of each participant's pay is withheld to aid the company, with the withholding to be reduced as the company's condition improves. The company operates in a number of States; its employees are represented by the Teamsters.

However, not all management efforts to reduce labor costs were successful:

- At American Airlines, unions representing 21,000 employees turned down a company request that employees accept a 5-percent pay reduction during the first quarter of 1982 and forgo raises for the rest of the year. An official of one of the unions said that the company had not proved that its financial condition warranted such a sacrifice.
- In the farm and construction equipment industry, 3,000 employees rejected Allis-Chalmers Corp.'s request for a 1-year wage freeze and other concessions that the company said were needed to help improve its ability to compete with other companies. An official of the Auto Workers said the company had reported a profit for the first 9 months of 1981 and its top executives were receiving excessive salaries.

Meatpacking contracts feature union concessions

The "old line" meatpacking companies' efforts to compete more effectively with newer, lower cost firms such as Iowa Beef Processors were strengthened when the United Food and Commercial Workers agreed to new contracts that provide for a number of wage and benefit concessions. The first settlement, with Armour and Co., set a pattern for accords with Wilson & Co. and George A. Hormel & Co. Later, other companies followed the pattern, bringing the total number of workers affected to about 40,000.

John Teets, chairman and chief executive officer of Armour (and chief executive officer of the parent Greyhound Corp.) called the contract "a historic first" for an industry that is in "total disarray." Teets said, "If we did not get this kind of contract, we would have to close many plants." Armour, which has closed 24 plants during the past 10 years, suffered a $5.7-million loss in 1980.

The new contract at Armour, negotiated slightly more than 8 months in advance of the scheduled expiration date of existing agreements, did not provide for any specified wage increase. However, the agreement is subject to a reopening on wages in September 1984, with the union permitted to strike if a settlement is not attained.

The cost-of-living clause, which provided for semiannual pay adjustments, was retained in the contract, but the 4,100 employees will not receive any actual adjustments. Instead, they will receive a one-time lump sum in December 1983 equal to the amount they would have received if the clause was operative during all of 1982. The payment will be at least $400, regardless of how few hours an employee worked in 1982. The lump-sum payment does not apply to workers hired after the effective date of the new contract. In addition, Armour is now permitted to pay new employees $1 less than the standard rate for their job during their first 60 days of work and 50 cents less during the following 30 days. The same reductions also will apply during the first 90 days and the succeeding 30 days for employees hired for new second or third shifts.

Benefit changes include a $2 increase in the pension rate, bringing it to $17 a month for each year of credited service. This change will be effective on September 1, 1985, the day after the contract expires.

In a concession to the union, Armour agreed not to close any plants, departments, or divisions before July 1, 1983. Armour also gave the union a copy of its capital investment plan for the next 5 years and will divulge its actual expenditures each year.

Jerry Wurf, AFSCME president, dies

Jerry Wurf, president of the State, County and Municipal Employees since 1964, died December 10 after a heart attack. During his tenure, the union grew from 220,000 to 1 million members, making it the largest public employee union in the AFL-CIO.

AFL-CIO President Lane Kirkland and secretary-treasurer Thomas R. Donohue called Wurf "one of the most dynamic figures of our time," and said that "the labor movement is richer because he passed our way."

Wurf's successor was General McEntee, head of the union's District Council 13 in Pennsylvania and a member of the union since 1958. In the weighted balloting by the 25-member executive board, McEntee received 483,080 of the electoral ballots cast and William Lucy, the union's secretary-treasurer, received 449,911.

Worker's effort to buy steel plant fails

A steelworker local's effort to save 3,000 jobs at Kaiser Steel Corp. suffered a setback when Kaiser said that an employer stock-ownership plan was not "desirable or workable." The local had started the purchase drive after the company announced plans to phase out its steelmaking operations in Fontana, Calif., and the nearby Eagle Mountain iron ore mine.

Kaiser operated at a profit during the first three quarters of 1981, but company officials said they did not view this as a turnaround from the losses suffered in each of the preceding 18 quarters. The company's plan calls for the continuation of steel finishing at Fontana, using purchased steel. Kaiser is the ninth largest firm in the industry; it does not have any other steelmaking plants.

Dupont workers reject union representation

The Steelworkers' 8-year organizing campaign at the DuPont Co. suffered a severe blow when 11,500 employees of 14 plants in seven States rejected representation by the union. The employees at six of the plants voted to retain their local independent unions while those at the other plants voted to remain nonunion.

John Oshinski, who has headed the union's organizing drive since 1979, said the DuPont workers turned down the opportunity to "throw off Dupont's total control of their lives," and thus, the "hard-fought campaign has now been concluded." Carl De Martino, DuPont's vice president for employee relations, called the result of the National Labor Relations Board elections "a strong endorsement of our policies and our sensitivity to people's needs."

DuPont has 66,000 employees eligible to be represented by unions. About 3,000 of them, at 13 plants, belong to international unions; about 23,000, at 33 plants, are represented by local independent unions. The Steelworkers represent a small number of workers at a facility in Biwabik, Minn. DuPont, the Nation's largest chemical maker, has about 100 plants in the United States.

Controllers can apply for other Federal jobs

There was another development in the dispute concerning the fate of the 11,500 fired air traffic controllers, as President Reagan modified his termination order to permit them to apply for Federal jobs, but not their old jobs. The controllers, discharged because of their strike against the Federal Government, can reapply for Federal employment in departments and agencies other than the Federal Aviation Administration.

In general, labor leaders expressed disappointment in the President's action. An official of AFL-CIO said, "This is not what the AFL-CIO Executive Council had in mind last week when it met with and urged the President to show compassion toward the air controllers." Robert E. Poli, president of the Professional Air Traffic Controllers Organization (PATCO) described the new policy as a "cruel hoax on both the fired controllers and the American taxpayer," explaining that, "there are few if any available Federal jobs."

Leaders of the Teamsters union, who also had met with the President as part of his efforts to improve the Administration's relations with organized labor, approved this change of policy.

J. J. O'Donnell, head of the Air Line Pilots Association, said ". . . any action the Administration takes, we are in accord with, 100 percent."

In a related development, the National Transportation Safety Board dismissed PATCO assertions that the air traffic control system was less safe than before the union's members were dismissed in August. However, the board did warn that continued heavy workloads for the 6,000 controllers and 4,000 supervisors and military controllers operating the system could eventually reduce flight safety.

A&P reduces its contribution to pension plan

The Great Atlantic & Pacific Tea Co. moved to stem operating losses by reducing the company's contribution to the pension plan for 10,000 salaried employees who are not represented by unions. A company official said the change was possible because the previous financing method did not fully take into account rising interest rates on fund investments, which resulted in a $200-million surplus.

Under the new formula, A&P's pension contribution will equal 4 percent of each employee's salary. Employees will contribute up to 6 percent of their salary, with A&P contributing an additional amount equal to half of what the employees pay in.

A&P also announced plans to close more unprofitable stores. The food store chain is the Nation's second largest, employing 65,000 workers in 30 States primarily east of the Mississippi River.

Private pension plans stressed

In a report on how to ensure adequate income for retirees, the Committee for Economic Development calls for more reliance on private pension plans and personal savings and less reliance on social security benefits. The nonpartisan group of business and academic leaders composing the committee said that with the current approach "future working generations will bear impossible funding burdens, and future retirees will face insecurity and hardship."

According to the committee, the overall cost of retirement programs rose from 2.3 percent of the Gross National Product in 1950 to 8.2 percent in 1977, and increasing social security costs had to be borne by future generations. To increase the role of private pension plans and personal savings, the committee recommended increasing the tax-free amounts that individuals can allocate to their personal retirement plans; making employees' contributions to private group plans tax deductible and encouraging employers to establish savings plans for employees; giving employers more flexibility in their pension plans, including delaying the normal retirement age to match future changes in social security laws; raising the eligibility age for full social security benefits to 68; and adjusting annual benefits according to changes in wages rather than the present method of adjustment according to movement of the Consumer Price Index.

Private secretaries can join union, court says

In a decision that was significant for thousands of office workers, the Supreme Court upheld the National Labor Relations Board's position that employees with access to confidential information are permitted to organize and are assured of other protections under the National Labor Relations Act, as long as the information does not involve labor-management relations. The board had held to this interpretation of the act (also known as the Wagner Act) since its passage in 1935.

The case arose when the personal secretary to the chief executive officer of the Hendricks County Rural Electric Membership Cooperative in Danville, Ind., was fired for joining other employees in petitioning for the reinstatement of a disabled worker. The secretary appealed to the National Labor Relations Board, which held that she was protected by the Wagner Act because she was not involved in labor relations matters.

However, this decision was reversed on appeal to the U.S. Court of Appeals for the Seventh Circuit, which ruled that "all secretaries working in a confidential capacity" are not covered by the act. Its decision was based on a 1974 Supreme Court ruling that managerial employees are not covered by the act. According to the Circuit Court, a footnote to the 1974 ruling also appeared to exclude all confidential employees.

Writing for the majority, Supreme Court Justice William J. Brennan, Jr., said the 1974 footnote was a mistake. He noted that in 1947 the Congress passed the Taft-Hartley Act, which amended the Wagner Act to cover "professional employees." Justice Brennan concluded that Congress passed the amendment with full knowledge of the National Labor Relations Board position and that most of the newly covered professionals would have access to confidential information.

In a opinion written by Justice Lewis F. Powell, the four dissenting members of the court said that secretaries should be excluded from coverage of the Wagner Act because they "are privy to the most sensitive details of management decision-making."

The court's majority decision also means that 18 employees of the Malleable Iron Range Co. in Beaver Dam, Wis., involved in a concurrent case may not be classified as confidential and may join a union, unless the employer shows another reason for excluding them. □

Major Agreements Expiring Next Month

This list of collective bargaining agreements expiring in March is based on contracts on file in the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more.

Employer and location	Industry	Union[1]	Number of workers
American Can Co. (Interstate)	Paper	Printing and Graphic	1,000
Arizona Public Service Co.	Utilities	Electrical Workers (IBEW)	2,300
Associated General Contractors of America, Inc.: Baltimore Chapter	Construction	Laborers	3,000

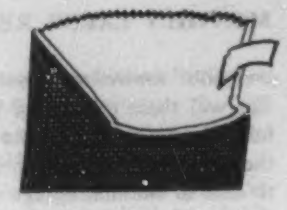
Book Reviews



Taking early retirement

Early Retirement—Boon or Bane? A Study of Three Large Corporations. By Dean W. Morse and Susan H. Gray. Montclair, N.J., Allanheld, Osmun & Co. Publishers, Inc., 1980. 180 pp. $23.00.

This book is based on the survey responses of 1,000 professional, managerial, and technical workers who had been employed by three large corporations—an unidentified manufacturer, a retailer, and a utility firm. Dean W. Morse and Susan H. Gray make use of the survey responses to assess what prompted these individuals to retire, their status at retirement, and their experiences, satisfactions, and problems after retiring. They also raise questions about corporate and public policy toward retirement, pensions, employment of older workers, and social security.

The book documents the shift toward earlier retirement, especially for men. The traditional 65-year-old-norm as constituting the age for retirement had become the exception rather than the rule for this group. Three-fourths or more of the respondents had retired before reaching 65. Among those who retired in 1968–69, only 13 percent retired before age 60. In the group retiring in 1976–77, 30 percent had retired before age 60. While the Administration and others have suggested raising the age for full social security retirement benefits to 68, the Morse-Gray study adds to the evidence indicating a continuing preference by Americans to retire at a substantially earlier age.

The Morse-Gray retirees are a special group in terms of their occupational status and income. They include no blue-collar workers or routine clerical or sales employees. Their mean preretirement annual family income was $34,500 in 1977 dollars. Their mean family income in the 12 months preceding the survey amounted to $19,500. Based on a combination of private pensions, social security, and investment income, this is the group with the resources for a "good old age."

However, even for this group the authors make it clear that retirement and nonretirement are far from mutually exclusive options. Two out of five of the respondents earned some kind of income after retiring. While the professionals and managers who worked usually did so on less than a full-time basis, they, like the retired policeman or civil servant who embarks on a second career, symbolize the large numbers of persons who are in the labor force and who are also retired. This group, with its special problems and prospects, receives scant recognition in the official labor force statistics.

The post-retirement experience of the group was largely a happy one. They had ample time and at least minimally adequate resources to pursue hobbies, engage in voluntary community activities, or tinker around the house and garden. In this respect, the findings in the Morse-Gray report are similar to those in an earlier Conference Board study, Walter Wikstrom's *The Productive Retirement Years of Former Managers* Conference Board Report No. 747, 1978.

This portrayal of a happy retirement is marred by one major problem—inflation. Corporate pensions, unlike social security, are seldom indexed, and the adjustments made for inflation tend to be partial and ad hoc. The possibilities of offsetting the loss of purchasing power, caused by inflation, by working are severely limited by the 50-percent reduction of social security benefits for incomes earned from work beyond the legal limit, currently $6,000. These fears, of course, are real ones although the remedies lie beyond the scope of the book. With inflation continuing at an average rate of 10 percent a year, more than three-fifths of the original purchasing power of a pension that was not indexed would have been lost by the end of a 10-year period. With a sharp decline from recent inflation rates, say to a 5-percent annual level, the loss of purchasing power during this period would amount to nearly two-fifths.

The authors provide many insights into the experiences of the particular group they surveyed. They are on less firm ground when they attempt to generalize about implications for public policy of this special group. Here, the authors tend to hedge when a bolder statement might be more beneficial to the reader. For instance, the authors note that "there may be merit in (former) Secretary of Commerce Juanita Kreps' proposal to move gradually to raise the age qualifications for full (social security) benefits from 65 to 68." Is there, or isn't there merit in the proposal?

The book raises many questions regarding a society in which people are living longer but working fewer years. The authors consider the need for alternatives such as part-time or part-year employment or consultant jobs for retired persons seeking a second career. But will these options or proposals to raise the age of full social security benefits to 68 make any sense unless there has been far more progress than has been the case to date in eliminating age discrimination in hiring or in the limit on earnings from work in the social security legislation?

In summary, the book is well written and it presents much useful information about the experiences of the group it surveys. It is less successful when it attempts to generalize from this experience a national policy for older Americans.

Risk assessment as a business tool

International Political Risk Assessment: The State of the Art. Edited by Theodore H. Moran. Washington, Georgetown University, School of Foreign Service, 1980. 80 pp. $10.

In the past few years, a Shah's dynasty has been hurled down in Iran, the Afghan nation has been overrun by Soviet tanks, a peacemaker has been gunned down in Egypt, and the international political risk analysts have found new prominence. This slender volume does the field of political risk studies a huge service by firmly establishing the focus of risk assessment as a tool for business decisionmaking rather than a curiosity in comparative politics and economics. The quality of the panel convened for the workshop that was the basis of this book, Theodore H. Moran's judgment in selecting papers, and the superb editorial pencil he exercised have combined to produce an excellent and timely product.

Two major channels of thought in political risk analysis emerge from this workshop. The first, put forth most explicitly in Conrad Pearson's how-to-do-it paper on expert-panel methodologies, emphasizes country-specific factors. Pearson's method elicits, weighs, blends, and standardizes the opinions of groups of country experts to attempt to estimate the chance some particular set of political events will occur in the country in question. Moran's concluding essay, on the other hand, emphasizes analysis of firm- or project-specific factors that tend to increase the investor's vulnerability to politically based action, regardless of the nature of the host country. These two approaches are, of course, the blades of the same scissors, as the economist Alfred Marshall might have analogized for the firm's "supply" of political vulnerability and the host's "demand" for certain forms of politico-economic aggression.

The concise nature of *International Political Risk Assessment* leads me to recommend it most highly to the senior multinational executives that would be faced with making decisions based in part on the work of political risk specialists; this excellent survey will encourage much more intelligent utilization of staff input. There is one question, however, that has puzzled me every time I have read or reviewed a piece on political risk management: the emphasis in all such pieces has been the Third World; why is this, given that the bulk of foreign direct investment is inter-industrial-nation and the potential financial impacts of such events as the recent Socialist electoral victories in France and Greece?

35. Wage and benefit settlements in major collective bargaining units, 1976 to date 94
36. Effective wage rate adjustments in major collective bargaining units, 1976 to date 95
37. Work stoppages, 1947 to date 95

NOTES ON CURRENT LABOR STATISTICS

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics. A brief introduction to each group of tables provides definitions, notes on the data, sources, and other material usually found in footnotes.

Readers who need additional information are invited to consult the BLS regional offices listed on the inside front cover of this issue of the *Review*. Some general notes applicable to several series are given below.

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might otherwise mask short-term movements of the statistical series. Tables containing these data are identified as "seasonally adjusted." Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years.

Seasonally adjusted labor force data in tables 2–7 were revised in the February 1981 issue of the *Review* to reflect the preceding year's experience. Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X-11/ARIMA, which was developed at Statistics Canada as an extension of the standard X-11 method. A detailed description of the procedure appears in *The X-11 ARIMA Seasonal Adjustment Method* by Estela Bee Dagum (Statistics Canada Catalogue No. 12-564E, February 1980). The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. Revisions of historical data continue to be made only at the end of each calendar year.

Annual revision of the seasonally adjusted payroll data in tables 11, 13, 16, and 18 begins with the August 1980 issue using the X-11 ARIMA seasonal adjustment methodology. New seasonal factors for productivity data in tables 33 and 34 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The resulting values are described as "real," "constant," or "1967" dollars.

Availability of information. Data that supplement the tables in this section are published by the Bureau of Labor Statistics in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule given below. The *BLS Handbook of Labor Statistics*, Bulletin 2070, provides more detailed data and greater historical coverage for most of the statistical series presented in the *Monthly Labor Review*. More information from the household and establishment surveys is provided in *Employment and Earnings*, a monthly publication of the Bureau, and in two comprehensive data books issued annually—*Employment and Earnings, United States* and *Employment and Earnings, States and Areas*. More detailed information on wages and other aspects of collective bargaining appears in the monthly periodical, *Current Wage Developments*. More detailed price information is published each month in the periodicals, the *CPI Detailed Report* and *Producer Prices and Price Indexes*.

Symbols

p = preliminary. To improve the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
r = revised. Generally this revision reflects the availability of later data but may also reflect other adjustments.
n.e.c. = not elsewhere classified.

Schedule of release dates for major BLS statistical series

Title and frequency (monthly except where indicated)	Release date	Period covered	Release date	Period covered	MLR table number
Employment situation	February 5	January	March 5	February	1–11
Producer Price Index	February 12	January	March 12	February	26–30
Consumer Price Index	February 25	January	March 23	February	22–25
Real earnings	February 25	January	March 23	February	14–20
Productivity and costs:					
Nonfinancial corporations	...	...	March 1	4th quarter	31–34

NOTE: Because of budget reductions in the Bureau of Labor Statistics, the work stoppages series was discontinued effective with the release of December 1981 data in January 1982.

EMPLOYMENT DATA FROM THE HOUSEHOLD SURVEY

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 60,000 households beginning in May 1981, selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons are (1) those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population; the **total labor force** includes military personnel. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons retired, those engaged in their own housework, those not working while attending school, those unable to work because of long-term illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy.

Full-time workers are those employed at least 35 hours a week; **part-time workers** are those who work fewer hours. Workers on part-time schedules for economic reasons (such as slack work, terminating or starting a job during the week, material shortages, or inability to find full-time work) are among those counted as being on full-time status, under the assumption that they would be working full time if conditions permitted. The survey classifies unemployed persons in full-time or part-time status by their reported preferences for full-time or part-time work.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data presented in table 1. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings*.

Data in tables 2–7 are seasonally adjusted, based on the seasonal experience through December 1980.

1. Employment status of the noninstitutional population, 16 years and over, selected years, 1950–80

EMPLOYMENT, HOURS, AND EARNINGS DATA FROM ESTABLISHMENT SURVEYS

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by 166,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

LABOR TURNOVER DATA in this section are compiled from personnel records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies. A sample of 40,000 establishments represents all industries in the manufacturing and mining sectors of the economy.

Definitions

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 14–20 include production workers in manufacturing and mining; construction workers in construction; and nonsupervisory workers in transportation and public utilities, in wholesale and retail trade, in finance, insurance, and real estate, and in services industries. These groups account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to eliminate the effects of price change. The **Hourly Earnings Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries. **Spendable earnings** are earnings from which estimated social security and Federal income taxes have been deducted. The Bureau of Labor Statistics computes spendable earnings from gross weekly earnings for only two illustrative cases: (1) a worker with no dependents and (2) a married worker with three dependents.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

Labor turnover is the movement of all wage and salary workers from one employment status to another. **Accession rates** indicate the average number of persons added to a payroll in a given period per 100 employees; **separation rates** indicate the average number dropped from a payroll per 100 employees. Although month-to-month changes in employment can be calculated from the labor turnover data, the results are not comparable with employment data from the employment and payroll survey. The labor turnover survey measures changes during the calendar month while the employment and payroll survey measures changes from midmonth to midmonth.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of June 1981 data, published in the August 1981 issue of the *Review*. Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Complete comparable historical unadjusted and seasonally adjusted data are published in a Supplement to Employment and Earnings (unadjusted data from April 1977 through March 1981 and seasonally adjusted data from January 1974 through March 1981) and in *Employment and Earnings, United States, 1909–78*, BLS Bulletin 1312–11 (for prior periods).

Data on recalls were shown for the first time in tables 12 and 13 in the January 1978 issue of the *Review*. For a detailed discussion of the recalls series, along with historical data, see "New Series on Recalls from the Labor Turnover Survey," *Employment and Earnings*, December 1977, pp. 10–19.

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20. See also *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976).

The formulas used to construct the spendable average weekly earnings series reflect the latest provisions of the Federal income tax and social security tax laws. For the spendable average weekly earnings formulas for the years 1979–81, see *Employment and Earnings*, November 1981, pp. 7–8. Real earnings data are adjusted using the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W).

NOTE: The industry divisions of mining; construction; tobacco manufactures (a major manufacturing group, nondurable goods); transportation and public utilities; and finance, insurance, and real estate are no longer shown. This is because the seasonal component in these is small relative to the trend-cycle, or irregular components, or both, and consequently cannot be precisely separated.

NOTE: The earnings expressed in 1977 dollars have been adjusted for changes in price level as measured by the Bureau's Consumer Price Index for Urban Wage Earners and Clerical Workers. These series are described in "The Spendable Earnings Series: A Technical Note on its Calculation," **Employment and Earnings and Monthly Report on the Labor Force**, February 1969, pp. 6-13. See also "Spendable Earnings Formulas, 1979-81," **Employment and Earnings**, November 1981, pp. 7-8.

UNEMPLOYMENT INSURANCE DATA

NATIONAL UNEMPLOYMENT INSURANCE DATA are compiled monthly by the Employment and Training Administration of the U.S. Department of Labor from monthly records of unemployment insurance activity prepared by State agencies. Railroad unemployment insurance data are prepared by the U.S. Railroad Retirement Board.

Definitions

Data for **all programs** represent an unduplicated count of insured unemployment under State programs, Unemployment Compensation for Ex-Servicemen, and Unemployment Compensation for Federal Employees, and the Railroad Insurance Act.

Under both State and Federal unemployment insurance programs for civilian employees, insured workers must report the completion of at least 1 week of unemployment before they are defined as unemployed. Persons not covered by unemployment insurance (about 10 percent of the labor force) and those who have exhausted or not yet earned benefit rights are excluded from the scope of the survey. **Initial claims** are notices filed by persons in unemployment insurance programs to indicate they are out of work and wish to begin receiving compensation. A claimant who continued to be unemployed a full week is then counted in the insured unemployment figure. The **rate of insured unemployment** expresses the number of insured unemployed as a percent of the average insured employment in a 12-month period.

An **application** for benefits is filed by a railroad worker at the beginning of his first period of unemployment in a benefit year; no application is required for subsequent periods in the same year. **Number of payments** are payments made in 14-day registration periods. The **average amount of benefit payment** is an average for all compensable periods, not adjusted for recovery of overpayments or settlement of underpayments. However, **total benefits** paid have been adjusted.

[1] Initial claims and State insured unemployment include data under the program for Puerto Rican sugarcane workers.

[2] Includes interstate claims for the Virgin Islands. Excludes transition claims under State programs.

[3] Excludes data on claims and payments made jointly with other programs.

[4] Includes the Virgin Islands. Excludes data on claims and payments made jointly with State programs.

[5] Cumulative total for fiscal year (October 1-September 30). Data computed quarterly.

NOTE: Data for Puerto Rico included. Dashes indicate data not available.

r = revised.

PRICE DATA

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Definitions

The **Consumer Price Index** is a monthly statistical measure of the average change in prices in a fixed market basket of goods and services. Effective with the January 1978 index, the Bureau of Labor Statistics began publishing CPI's for two groups of the population. One index, a new CPI for All Urban Consumers, covers 80 percent of the total noninstitutional population; and the other index, a revised CPI for Urban Wage Earners and Clerical Workers, covers about half the new index population. The All Urban Consumers index includes, in addition to wage earners and clerical workers, professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctor's and dentist's fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. Prices are collected from over 18,000 tenants, 24,000 retail establishments, and 18,000 housing units for property taxes in 85 urban areas across the country. All taxes directly associated with the purchase and use of items are included in the index. Because the CPI's are based on the expenditures of two population groups in 1972–73, they may not accurately reflect the experience of individual families and single persons with different buying habits.

Though the CPI is often called the "Cost-of-Living Index," it measures only price change, which is just one of several important factors affecting living costs. Area indexes do not measure differences in the level of prices among cities. They only measure the average change in prices for each area since the base period.

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes contains about 2,800 commodities and about 10,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (that is, finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings.

Price indexes for the output of selected SIC industries measure average price changes in commodities produced by particular industries, as defined in the *Standard Industrial Classification Manual 1972* (Washington, U.S. Office of Management and Budget, 1972). These indexes are derived from several price series, combined to match the economic activity of the specified industry and weighted by the value of shipments in the industry. They use data from comprehensive industrial censuses conducted by the U.S. Bureau of the Census and the U.S. Department of Agriculture.

Notes on the data

Beginning with the May 1978 issue of the *Review*, regional CPI's cross classified by population size, were introduced. These indexes will enable users in local areas for which an index is not published to get a better approximation of the CPI for their area by using the appropriate population size class measure for their region. The cross-classified indexes will be published bimonthly. (See table 24.)

For further details about the new and the revised indexes and a comparison of various aspects of these indexes with the old unrevised CPI, see *Facts About the Revised Consumer Price Index*, a pamphlet in the Consumer Price Index Revision 1978 series. See also *The Consumer Price Index: Concepts and Content Over the Years*, Report 517, revised edition (Bureau of Labor Statistics, May 1978).

For interarea comparisons of living costs at three hypothetical standards of living, see the family budget data published in the *Handbook of Labor Statistics, 1977*, Bulletin 1966 (Bureau of Labor Statistics, 1977), tables 122–133. Additional data and analysis on price changes are provided in the *CPI Detailed Report* and *Producer Prices and Price Indexes*, both monthly publications of the Bureau.

As of January 1976, the Wholesale Price Index (as it was then called) incorporated a revised weighting structure reflecting 1972 values of shipments. From January 1967 through December 1975, 1963 values of shipments were used as weights.

For a discussion of the general method of computing consumer, producer, and industry price indexes, see *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), chapters 13–15. See also John F. Early, "Improving the measurement of producer price change," *Monthly Labor Review*, April 1978, pp. 7–15. For industry prices, see also Bennett R. Moss, "Industry and Sector Price Indexes," *Monthly Labor Review*, August 1965, pp. 974–82.

[1] Data for August 1981 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[2] Not available.

[3] Prices for natural gas are lagged 1 month.

[4] Includes only domestic production.

[5] Most prices for refined petroleum products are lagged 1 month.

[6] Some prices for industrial chemicals are lagged 1 month.

r = revised.

c = corrected.

28. Producer Price indexes, for special commodity groupings

[1967=100 unless otherwise specified]

Commodity grouping	Annual average 1980	1980	1981											
		Dec.	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.[1]	Sept.	Oct.	Nov.	Dec.
All commodities — less farm products	269.8	281.2	285.4	288.8	291.9	295.0	296.1	296.7	298.0	r298.7	298.3	299.4	299.3	300.0

[1] Data for August 1981 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

r = revised.
c = corrected.

PRODUCTIVITY DATA

PRODUCTIVITY DATA are compiled by the Bureau of Labor Statistics from establishment data and from estimates of compensation and output supplied by the U.S. Department of Commerce and the Federal Reserve Board.

Definitions

Output is the constant dollar gross domestic product produced in a given period. Indexes of **output per hour of labor input**, or labor productivity, measure the value of goods and services produced per hour of labor. **Compensation per hour** includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. The data also include an estimate of wages, salaries, and supplementary payments for the self-employed, except for nonfinancial corporations, in which there are no self-employed. **Real compensation per hour** is compensation per hour adjusted by the Consumer Price Index for All Urban Consumers.

Unit labor cost measures the labor compensation cost required to produce one unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current dollar gross domestic product and dividing by output. In these tables, **unit nonlabor costs** contain all the components of unit nonlabor payments except unit profits. **Unit profits** include corporate profits and inventory valuation adjustments per unit of output.

The **implicit price deflator** is derived by dividing the current dollar estimate of gross product by the constant dollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

The use of the term "man hours" to identify the labor component of productivity and costs, in tables 31 through 34, has been discontinued. **Hours of all persons** is now used to describe the labor input of payroll workers, self-employed persons, and unpaid family workers. **Output per all-employee hour** is now used to describe labor productivity in nonfinancial corporations where there are no self-employed.

Notes on the data

In the private business sector and the nonfarm business sector, the basis for the output measure employed in the computation of output per hour is Gross Domestic Product rather than Gross National Product. Computation of hours includes estimates of nonfarm and farm proprietor hours.

Output data are supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics.

Beginning with the September 1976 issue of the *Review*, tables 31–34 were revised to reflect changeover to the new series—private business sector and nonfarm business sector—which differ from the previously published total private economy and nonfarm sector in that output imputed for owner-occupied dwellings and the household and institutions sectors, as well as the statistical discrepancy, are omitted. For a detailed explanation, see J. R. Norsworthy and L. J. Fulco, "New sector definitions for productivity series," *Monthly Labor Review*, October 1976, pages 40–42.

31. Annual indexes of productivity, hourly compensation, unit costs, and prices, selected years, 1950–80

[1977=100]

LABOR-MANAGEMENT DATA

MAJOR COLLECTIVE BARGAINING DATA are obtained from contracts on file at the Bureau of Labor Statistics, direct contact with the parties, and from secondary sources. Additional detail is published in *Current Wage Developments*, a monthly periodical of the Bureau. Data on work stoppages are based on confidential responses to questionnaires mailed by the Bureau of Labor Statistics to parties involved in work stoppages. Stoppages initially come to the attention of the Bureau from reports of Federal and State mediation agencies, newspapers, and union and industry publications.

Definitions

Data on wage changes apply to private nonfarm industry agreements covering 1,000 workers or more. Data on wage and benefit changes *combined* apply only to those agreements covering 5,000 workers or more. **First-year wage settlements** refer to pay changes going into effect within the first 12 months after the effective date of the agreement. **Changes over the life of the agreement** refer to total agreed-upon settlements (exclusive of potential cost-of-living escalator adjustments) expressed at an average annual rate. **Wage-rate changes** are expressed as a percent of straight-time hourly earnings, while **wage and benefit changes** are expressed as a percent of total compensation.

Effective wage-rate adjustments in major bargaining units measure actual changes during the reference period, whether the result of a newly negotiated increase, a deferred increase negotiated in an earlier year, or a cost-of-living adjustment. Average adjustments are affected by workers receiving no adjustment, as well as by those receiving increases or decreases.

Work stoppages include all known strikes or lockouts involving six workers or more and lasting a full shift or longer. Data cover all workers idle one shift or more in establishments directly involved in a stoppage. They do not measure the indirect or secondary effect on other establishments whose employees are idle owing to material or service shortages.

35. Wage and benefit settlements in major collective bargaining units, 1976 to date

[In percent]

How to order BLS publications

PERIODICALS

Order from (and make checks payable to) Superintendent of Documents, Washington, D.C. 20402. For foreign subscriptions, add 25 percent.

Monthly Labor Review. The oldest and most authoritative government research journal in economics and the social sciences. Current statistics, analysis, developments in industrial relations, court decisions, book reviews. $23 a year, single copy $3.50.

Employment and Earnings. A comprehensive monthly report on employment, hours, earnings, and labor turnover by industry, area, occupation, et cetera. $31 a year, single copy $3.75.

Occupational Outlook Quarterly. A popular periodical designed to help high school students and guidance counselors assess career opportunities. $8 for four issues, single copy $2.75.

Current Wage Developments. A monthly report about collective bargaining settlements and unilateral management decisions about wages and benefits; statistical summaries. $14 a year, single copy $2.50.

Producer Prices and Price Indexes. A comprehensive monthly report on price movements of both farm and industrial commodities, by industry and stage of processing. $20 a year, single copy $3.25.

CPI Detailed Report. A monthly periodical featuring detailed data and charts on the Consumer Price Index. $20 a year, single copy $3.50.

PRESS RELEASES

The Bureau's statistical series are made available to news media through press releases issued in Washington. Many of the releases also are available to the public upon request. Write: Bureau of Labor Statistics, Washington, D.C. 20212.

Regional. Each of the Bureau's eight regional offices publishes reports and press releases dealing with regional data. Single copies available free from the issuing regional office.

BULLETINS AND HANDBOOKS

About 140 bulletins and handbooks published each year are for sale by regional offices of the Bureau of Labor Statistics (see inside front cover) and by the Superintendent of Documents, Washington, D.C. 20402. Orders can be charged to a deposit account number or checks can be made payable to the Superintendent of Documents. Visa and MasterCard are also accepted; include card number and expiration date. Among the bulletins and handbooks currently in print:

Occupational Outlook Handbook, 1980–81 Edition. Bulletin 2075. A useful resource supplying valuable assistance to all persons seeking satisfying and productive employment. $9, paperback; $12, cloth cover.

Employment Trends in Computer Occupations. Bulletin 2101, October 1981. Results of a BLS study of employment of workers in five computer-related occupations. $3.50.

National Survey of Professional, Administrative, Technical, and Clerical Pay, March 1981. Bulletin 2108. Summarizes the results of the Bureau's annual salary survey for 23 occupations. Data for purchasing assistants and photographers published for the first time. $4.75.

Occupational Projections and Training Data. Bulletin 2052. Presents both general and detailed information on the relationship between occupational requirements and training needs. (Updates Bulletin 2020.) $5.50.

Exploring Careers. Bulletin 2001. A new career guidance resource designed for junior high school students but useful for older students as well. Includes occupational narratives, evaluative questions, suggested activities, career games, and photographs. $11.

Inudstry Wage Survey: Life Insurance, February 1980. Bulletin 2119. A summary of the results of a survey of occupational wages and employee benefits in home and regional offices of life insurance carriers in February 1980. $3.25.

Employee Benefits in Industry, 1980. Bulletin 2107. The results of a 1980 BLS survey of the incidence and characteristics of private sector employee benefit plans. $3.25.

Perspectives on Working Women: A Databook. Bulletin 2080. Presents comprehensive statistics on characteristics of working women. Topics covered in 100 tables and brief text include extent of work experience, marital and family status, education, earnings, occupations, and race and Hispanic ethnicity. (Updates Bulletin 1977.) $5.00.

Youth Unemployment: An International Perspective. Bulletin 2098. An examination of the labor market experience of youth in the United States and eight other industrial countries from the early 1960's to the late 1970's. $3.50.

REPORTS AND PAMPHLETS

Single copies available free from the BLS regional offices or from the Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C. 20212.

Major Programs of the Bureau of Labor Statistics. Report 552. A summary of the Bureau's principal programs, including data available, sources, uses, and publications.

Employment in Perspective: Working Women. A quarterly report series presenting highlights of current data on women in the labor force.

Employment in Perspective: Minority Workers. A quarterly report series presenting highlights of current data on blacks and persons of Hispanic origin in the labor force.

MONTHLY LABOR REVIEW

U.S. Department of Labor
Bureau of Labor Statistics
Every month, 12 times a year

. . . is the oldest,
most authoritative
Government journal
in its field

- Articles and reports on employment, prices, wages, productivity, job safety, and economic growth
- 40 pages of current labor statistics
- Developments in industrial relations
- Industry wage surveys
- Book reviews and notes
- Foreign labor developments

Mail to:
Superintendent of Documents

MONTHLY LABOR REVIEW

MARCH 1982
VOLUME 105, NUMBER 3

Henry Lowenstern, Editor-in-Chief
Robert W. Fisher, Executive Editor

Robert W. Bednarzik and others 3 **The employment situation in 1981: new recession takes its toll**
By yearend, joblessness had surged, propelled by cutbacks in housing, auto, and related industries; the number of discouraged workers reached a new high

Shirley J. Smith 15 **New worklife estimates reflect changing profile of labor force**
The working life expectancy of men continued to level off during 1970–77; however, that of women increased, especially among those 25 to 34 years old

J. P. Goldberg, W. T. Moye 21 **The AFL and a national BLS: labor's role is crystallized**
From the labor federation's first convention in 1881 to the establishment of the Labor Department in 1913, interests of the AFL and BLS often converged

James D. York 30 **Nonwool yarn mills experience slow gains in productivity**
Although new equipment and techniques aided productivity growth in 1958–79, the 2.3-percent rate of increase was less than for manufacturing as a whole

Labor Month In Review

ECONOMIC HARDSHIP. To what extent has the link between unemployment and economic hardship been weakened? A new Bureau of Labor Statistics study sheds some light on that question. Data for the study are drawn from the March 1980 Current Population Survey. Excerpts:

Economic and social changes over the past 40 years have altered the relationship between a worker's experience of unemployment and the family's income position. Unemployment compensation and other forms of social insurance have helped to offset at least part of the reduction in family income resulting from the loss of a job. In addition, the growth of two-earner families has made family income less sensitive to fluctuations in the earnings of a single family member.

Poverty-jobless link. If it is an oversimplification to say that unemployment always means hardship for families, it is equally an oversimplification to say that the connection between the two has been broken.

The data confirm that today poverty does not always accompany unemployment. Of the 18 million workers who experienced some spells of unemployment during 1979, only 14 percent belonged to families whose incomes were below the poverty level. Similarly, about 13 percent of the workers who worked part time involuntarily belonged to families in poverty. Even for fully employed workers whose hourly earnings were at or near the minimum wage, the tie between the earnings level of individual workers and the income of their families was not a tight one. Approximately 4.8 million workers had annual earnings that implied that they were working at or near the minimum wage; less than one-quarter of these (1.1 million) were in families of households below the poverty level.

Family make-up link. On the other hand, a more intensive examination of the data suggests that the overall numbers hide important relationships. The links between a worker's low earnings, or an interruption in those earnings, and family income depend greatly on the composition of the family to which the worker belongs. For workers other than husbands in married-couple families (these workers include wives and "others," mostly youth), low earnings or interruptions in earnings occasioned by unemployment or part-time work are not, in the vast majority of cases, associated with family income that falls below the poverty level. However, the contrary is the case for workers who do not reside in a married-person household and who experience low earnings, unemployment, or part-time work. For example, the poverty rate reaches 51 percent for families maintained by women who could only find part-time work, and nearly one-half of the families of unemployed women who maintain families are below the poverty level. Much the same picture emerges for unrelated individuals (persons who do not maintain families) and, to a somewhat lesser extent, for men who maintain families.

Thus, the analysis suggests that, for many families, poverty is not a direct and inevitable result of unemployment, short workweeks, or low earnings experienced by one or more family members. But it is primarily in married-couple households having two or more earners that the traditional relationship between labor market status and the economic condition of the family is broken. For other types of households—men and women who maintain families and persons who live by themselves outside of family units—low earnings, unemployment, short workweeks, and part-year work are linked fairly closely with economic hardship.

Qualification. These conclusions must be qualified in the sense that there are many cases which cannot be thoroughly explored from the data available. For example, when a middle-income worker is laid off from a well paying job, the family may have sufficient resources to avoid falling all the way to the poverty level; nevertheless, possible consequences such as foreclosures or mounting debt can entail substantial economic hardship, even if not as extreme as a decline to poverty status. In addition, there are many cases where the interruption of labor income means severe economic distress which cannot be evaluated with existing data. For example, it is known that the unemployment rate for wives whose husbands are unemployed is much higher than that of wives whose husbands are employed. When two workers in a married-couple household are unemployed, the implications for family income are undoubtedly severe, but the present data are not detailed enough to analyze these cases.

Data include, in addition to normal wage and salary income, cash payments from such sources as unemployment compensation and other forms of social insurance. Not included are noncash forms of assistance (such as food stamps) to which a low-income family may be entitled. They are, however, the most comprehensive data on family income yet assembled that can be related to the labor force status and activities of individual family members.

The 58-page study also analyzes other aspects of insufficient employment and links these individual employment problems to family income and poverty.

Linking Employment Problems to Economic Status, BLS Bulletin 2123, is available from the Superintendent of Documents, Government Printing Office, Washington, D.C. 20402, and from BLS regional offices listed on the inside front cover. Price $4.50. □

The employment situation in 1981: new recession takes its toll

By yearend, joblessness had surged, propelled by cutbacks in housing, auto, and related industries; employment was back to its year-ago level; the employment-population ratio was at a 4-year low; and the number of discouraged workers and involuntary part-timers topped previous records

ROBERT W. BEDNARZIK, MARILLYN A. HEWSON,
AND MICHAEL A. URQUHART

The labor market turned sour in mid-1981 as the economy entered its eighth postwar recession following a rather weak and brief recovery. High interest rates continued to plague the housing and automobile industries, which never totally recovered from 1980, and the weakness of these two critical industries had begun to spread to related industries as 1981 unfolded. Product orders were reduced, leading to increased inventories, sharp cutbacks in production, and eventually to increased layoffs and other job losses.

The labor market, which received its second jolt in as many years, was experiencing precipitous declines by the final quarter of 1981. The number of unemployed reached 9.6 million—8.8 percent of the work force—by the end of the year. There were also large increases in the number of persons reporting discouragement over job prospects and the number still employed but reporting reduced workweeks.

Although by the end of 1981 total employment was near its year ago level, the pattern during the year was one of growth through spring, stagnation in the summer, and pronounced cutbacks at the end of the year. The percentage of the population employed was at a 4-year low by December.[1]

Unemployment rises sharply at yearend

The recovery from the 1980 recession had only a marginal impact on the Nation's unemployment rate, which never dipped below the 7.2-percent mark (seasonally adjusted) during 1981. Despite an increase in total employment of 1.8 million between the second quarters of 1980 and 1981, the growth was insufficient to have a marked improvement on joblessness, as the unemployment rate only dropped from the 1980 high of 7.8 percent to 7.2 percent in July 1981. As economic activity declined in the second half, the number of jobless persons jumped by nearly 2 million from July to December, and the overall unemployment rate reached 8.8 percent, very close to the post-World War II high of 9.0 percent recorded in May 1975.

Given the persistently high rates of unemployment

Robert W. Bednarzik and Michael A. Urquhart are economists in the Division of Employment and Unemployment Analysis, and Marillyn A. Hewson is an economist in the Division of Monthly Industry Employment Statistics, Bureau of Labor Statistics.

since mid-1980, the fourth quarter surge pushed the unemployment rates for many worker groups beyond those reached during the 1980 recession and, in some cases, exceeded the postwar records of the 1973–75 recession. The following tabulation shows the peak monthly jobless rates (seasonally adjusted) for major demographic groups in 1975, 1980, and 1981:

	1975	*1980*	*1981*
All workers . .	9.0 (May)	7.8 (July)	8.8 (Dec.)
Men, age 20 and over	7.3 (May)	6.7 (July)	7.9 (Dec.)
Women, age 20 and over	8.5 (Apr.)	6.7 (July)	7.4 (Dec.)
Teenagers	20.9 (June)	19.1 (July)	21.5 (Dec.)
White	8.4 (May)	6.9 (July)	7.7 (Dec.)
Blacks	15.4 (Sept.)	15.2 (July)	17.3 (Dec.)

Joblessness among men (20 years and over), which had shown some improvement early in the recent recovery period, increased 2.2 percentage points between July and December 1981 to 7.9 percent, exceeding the postwar high reached in 1975. The rate for women showed virtually no improvement in the recovery period, remaining at about 6.7 percent before rising to 7.4 percent by December. While this was more than half a point above the 1980 high for women, it was still more than a point below the 1975 record. The greater increase in unemployment among men was primarily due to their predominance in industries experiencing extensive job cutbacks. In December, the rate for men actually exceeded that for women, an unusual labor market occurrence.

The employment situation for teenagers continued to worsen; their unemployment rate has shown a step-like pattern of deterioration since mid-1979. By the end of 1981, the teenage rate of 21.5 percent was the highest ever recorded, more than half a point above that reached in 1975. Joblessness among women who maintain families followed a similar pattern, rising from 8.1 to 9.1 percent between the third quarters of 1979 and 1980 before leaping to 10.7 percent in the third quarter of 1981, about a point above their 1975 peak.

The rise in unemployment among blacks[2] affected both adults and teenagers and occurred earlier in the year than was the case for white workers. Indeed, unemployment among blacks showed virtually no recovery from the 1980 recession and their jobless rate was hitting new records by summer. Their overall rate was 17.3 percent by December. The black share of total unemployment was 21 percent in 1981, double their labor force share. This was little changed from 1980, but higher than their share during the early 1970's. Unemployment for Hispanic workers seesawed over the year, ending the year at slightly above 11 percent, about a point higher than a year ago. Most of the increase was accounted for by women age 20 and over. Persons of Puerto Rican origin experienced the highest rate of joblessness in 1981, averaging 13.6 percent for the year; the unemployment rate for persons of Mexican origin averaged 10.5 percent and those of Cuban origin, 9 percent.

Industry and occupation. Substantial fourth quarter increases pushed joblessness among workers in most major industry groups above 1980 recession rates by yearend.[3] (See table 1.) Attention during the year was focused on those industries directly affected by continued high interest rates, most notably housing construction, automobile manufacturing, and related industries.

There was some slight improvement in the unemployment rate for workers in the construction industry from the third quarter of 1980 to the first quarter of 1981. The rate moved steadily higher, as the year progressed, reaching 18.1 percent in December. The patterns for the housing-related lumber and wood products, furniture and fixtures, and stone, clay and glass industries were similar. Two of the three detailed manufacturing industries whose 1981 peak jobless rates exceeded those reached in both 1980 and in 1975 were housing related; the other, food processing, has undergone several technological changes in recent years to better insulate itself against inflationary pressures. The following tabulation show peak monthly unemployment rates in selected manufacturing industries:

	1975	*1980*	*1981*
Lumber and wood products	16.0 (May)	17.0 (June)	22.0 (Dec.)
Stone, clay and glass	11.8 (Apr.)	10.7 (May)	12.7 (Dec.)
Food processing . .	11.5 (June)	10.4 (Dec.)	12.1 (Dec.)

Except for furniture and fixtures, the manufacturing industries whose 1981 peak jobless rates exceeded those attained in 1980, but not those in 1975, were auto related:

	1975	*1980*	*1981*
Furniture and fixtures	16.4 (Feb.)	11.3 (Sep.)	13.2 (Dec.)
Textiles	17.9 (Jan.)	11.9 (Oct.)	14.1 (Dec.)
Chemicals	7.9 (May)	5.3 (Aug.)	6.2 (Dec.)
Rubber and plastics	15.5 (Mar.)	12.9 (July)	15.1 (Jan.)

December unemployment rates for workers in primary and fabricated metals, machinery, and electrical equipment, while up from earlier in the year, were still below 1980 highs.

Joblessness among workers in the automobile industry showed improvement between the third quarter of 1980 and the second quarter of 1981, dropping from 22.4 percent to 11.8 percent, but hit 21.7 percent in December. Most of the reduction was due to workers finding jobs elsewhere (although some auto workers were

recalled to their jobs), because employment growth in the industry was essentially nonexistent after mid-1979.

The dramatic yearend surge in joblessness brought the jobless rate for all factory workers to 11.0 percent in December, 11.8 percent for those in durables and 9.6 percent for nondurables.

Among the major occupational groups, the jobless pattern showed generally little or no improvement for the first three quarters followed by a surge in the fourth, especially among blue-collar workers. Their jobless rate was up to 12.7 percent by December, as craftworkers, operatives, and nonfarm laborers all recorded increases. White-collar unemployment was also up in December to 4.5 percent, with the sharpest increase occurring among professional and technical workers, whose December rate of 3.4 percent almost equaled its previous high in 1975. Unemployment among clerical workers was also up at yearend.

Reasons for unemployment. In the household survey, jobless persons are categorized according to whether they lost their last job (due to either a layoff or a permanent separation), voluntarily left a job, entered the labor force for the first time, or began to search for work after a period of absence from the labor market. The distribution of total unemployment by these groups changes over the business cycle. During economic contractions, there, of course, are sharp increases in job-loss unemployment, especially in that due to layoff. In contrast, there is normally a decline in the number of persons who began looking for work because they quit their last job.

As a result of the weak recovery from the 1980 recession, job losers' share of total unemployment remained high throughout the year. (See table 2.) The first quarter level of 4 million, the low for the year, was still more than a million above pre-1980 recession levels. While historically the percentage of job losers usually drops to around 40 percent during recoveries, in 1981 they represented about 50 percent of total unemployment through the third quarter. At 56 percent in December, the percentage of job losers was very close to the 58-percent high reached in the 1973–75 recession.

The number of persons on layoff, a very sensitive cyclical measure, did show a decline of a half million between the third quarters of 1980 and 1981, before rising sharply in the final quarter. At 2 million in December, the number on layoff was at the peak level reached in the 1975 recession.

Duration of unemployment. An important consideration in the evaluation of overall unemployment is the average duration of joblessness. Short spells of unemployment are often considered to be only a result of frictions in the labor market, as workers move from job to job and labor supply adjusts to changes in demand. The longer a period of unemployment, the greater the economic hardship that is normally associated with it.

Median duration, in weeks	5.7	6.1	7.3	7.4	7.2	7.2	7.0	6.8
Average (mean) duration, in weeks	10.7	11.2	12.4	13.4	14.1	13.8	14.0	13.2

The two average measures of unemployment duration—the mean and the median—differ in regard to their sensitivity to changes in the number of persons experiencing either short- or long-term joblessness, the median being less sensitive to extreme values. While both generally move in the same direction as the overall unemployment rate, there is a definite lagged response at economic turning points. For example, during the 1980 recession, very long-term unemployment (27 weeks or longer) continued to increase—from 915,000 in the third quarter of 1980 to more than 1.2 million in the first quarter of 1981. (See table 2.) Due to the brevity of the recovery, such joblessness declined only slightly in the subsequent two quarters before increasing again in the last quarter.

The lag in the response of long-term joblessness to an economic upturn has different implications for the mean and median duration figures. For example, although the rate of unemployment in the 1980 recession never exceeded the 7.8-percent figure attained in July, the mean duration of unemployment continued upward through the first quarter of 1981. In economic downturns, the mean duration will frequently decline for a few months, as the newly unemployed enter the jobless stream. Thus, in 1981, mean duration actually fell in the fourth quarter. The median duration measure, by contrast, usually responds much faster to changing economic conditions and moves more in tandem with overall unemployment, because it is dominated by the movement of the shorter-term duration groups. During the 1980 recession, for example, the increase in the median generally followed that of the overall rate, though lagging somewhat in the recovery phase. In 1981, however, the yearend rise in unemployment was so steep that median duration also declined a bit in the fourth quarter. Both measures can be expected to increase in the months ahead.

Shortened workweeks and discouragement

Just as the health of the economy influences unemployment, it similarly influences the number of people who report that they want a job but are not looking for one because they believe no work is available—so-called "discouraged workers." In addition, as the Nation enters a recession, employers frequently reduce hours where possible before laying off employees. Persons on such shortened workweeks are termed involuntary part-time workers. They, along with discouraged workers, are not reflected in the official count of unemployment, although information on both groups is important in achieving a full appreciation of the nature and magnitude of the underutilization of human resources.

Nonagricultural workers involuntarily on part-time schedules totaled more than 5 million, or 5.6 percent of the nonfarm "at-work" population, in the fourth quarter of 1981. This was the highest level recorded since collection of the data began in 1955. Slack work, the most cyclical component of involuntary part-time work, accounted for half of this total. The following tabulation shows the distribution of involuntary part-time workers (seasonally adjusted quarterly averages):[4]

			Part time due to—	
	Number	*Percent*	*Slack work*	*Could find only part time*
1980:				
I	3,546	3.9	1.9	1.5
II	4,171	4.6	2.5	1.7
III	4,290	4.8	2.5	1.8
IV	4,216	4.7	2.3	1.9
1981:				
I	4,323	4.7	2.4	2.0
II	4,166	4.6	2.2	2.0
III	4,460	4.9	2.4	2.1
IV	5,108	5.6	2.8	2.3

The number of persons on shortened workweeks had remained high during the recovery period between the 1980 and 1981 recessions, perhaps an indication of the general sluggishness and weakness in the labor market that prevailed at that time. There has been a growing tendency in recent years for employers to keep workers on a shortened workweek for a longer spell than in earlier years.[5] Also, as shown above, the proportion of involuntary part-timers who reported they could only find part-time work has continued to grow in recent years, as it has for the last decade. Thus, just as the job picture is now characterized by higher overall average unemployment, it is also characterized by a higher proportion of involuntary part-time work.

Discouraged workers have neither worked nor have they looked for work during the 4-week period prior to enumeration. Historically, the number of such workers tends to move in tandem with overall unemployment.[6] Given the generally weak economy and higher than average unemployment during 1981, the number of discouraged workers remained above the million mark throughout the year. (See table 3.) Even the deep 1973–75 recession did not result in such consistently high levels. The increase in the number of discouraged workers in the fourth quarter of 1981 brought the level to 1.2 million, slightly above the previous high recorded in the third quarter of 1975 and about 140,000 above the level of a year earlier. Nearly three-fourths of the recently discouraged cited job market factors as the reason for not looking for work, the component which gives discouragement its cyclical nature. Most of the 1981 increase occurred in the last quarter. Women and blacks are disproportionately represented among the discouraged. They made up 64 and 30 percent of these workers in the last quarter of 1981, compared with 43 and 12 percent of the labor force.

The employment picture

With strong growth during the first half of 1981, total employment, as measured by the survey of households, appeared to have regained much of the momentum lost during the 1980 downturn. The number of persons employed rose by 2.1 million between June's 1980 low and July 1981, reaching the 100.9-million mark in July. As the economy turned downward again in the third quarter, however, it was evident that a new recession was at hand. Especially sharp declines in the fourth quarter resulted in cutbacks totaling 1.3 million between July and December. Table 4 traces these developments on a quarterly basis for a number of worker groups.

The employment-population ratio, which measures the proportion of the population that is employed, is a useful statistic for putting these changes into perspective.[7] It is particularly helpful in discerning the cyclical

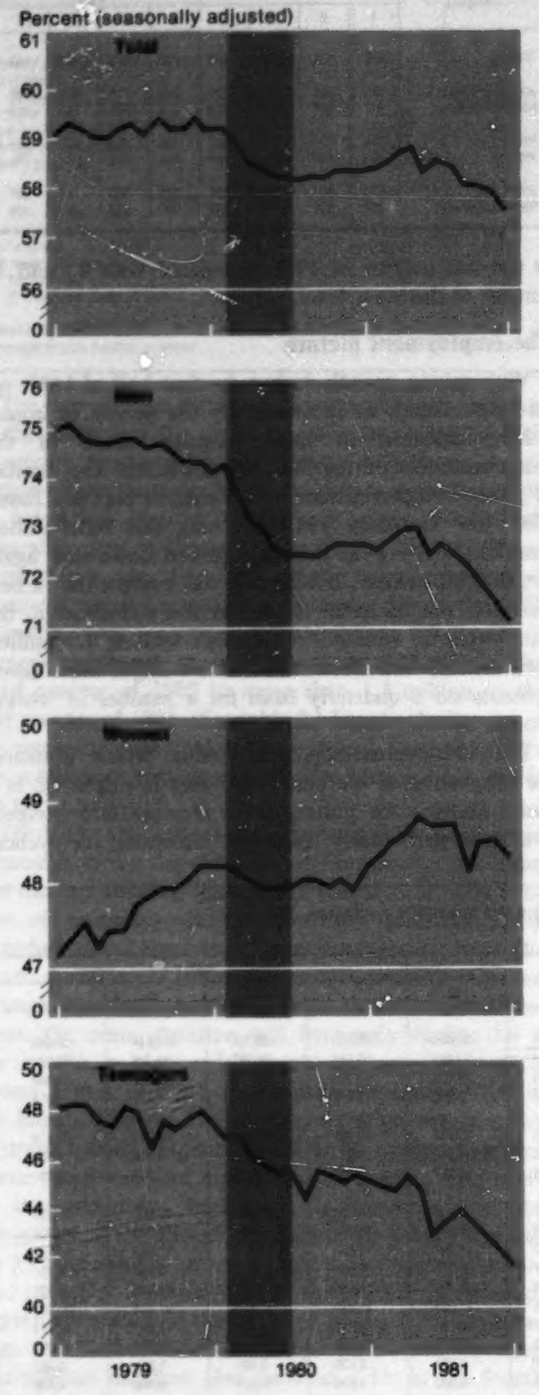
Chart 1. Employment-population ratios for selected workers, 1979-81



Note: Shaded area indicates the 1980 recession.

impact of an economic downturn on workers. Because the population is continually growing for most worker groups, a decline in the overall employment population ratio, even while employment is showing some growth, clearly reflects the inability of the economy to generate enough jobs.

From a record high of 59.4 percent in late 1979, the ratio dropped to 58.3 percent by the end of 1980, reflecting the recession and an initially weak recovery. Some improvement occurred in the first half of 1981—as the ratio inched up to 58.8 percent—but with the precipitous decline of the economy in the second half, the ratio was down to 57.5 percent by December, its lowest level in more than 4 years. During the second half, declines in the ratio were heavy among men and teenagers, while the proportion of women who were employed dipped slightly.[8] (See chart 1.)

During the first half of 1981, strong job growth was evident among men, as they regained the job losses experienced during the 1980 downturn. By midyear, this group had registered a 550,000 advance in employment. However, employment rose only marginally during the third quarter, and then dropped by more than 400,000 in the closing months of 1981. These developments, when coupled with an increase in population, caused the employment-population ratio for men to decrease by 1.1 percentage points over the year, to 71.5 percent, a new low for this group. As industrial production declined in response to an involuntary build-up in inventories, the demand for labor in the goods-producing sector slackened accordingly. Because roughly 7 of 10 workers in the goods-producing sector are adult men, it is not surprising that they were severely affected by production cutbacks.

By contrast, women increased their employment over the year despite the recession. Their jobs are concentrated in the service-producing sector, which historically has been less responsive to cyclical movements in the economy than the goods sector. However, employment among women grew very little in the second half of the year as the downturn became more broadly based. By the fourth quarter, employment among women stood at 39.8 million, up 1.1 million from its year-earlier level. The employment-population ratio for women reached a new high of 48.7 percent in the second quarter and then slipped a bit in the last half of the year to 48.4 percent. However, this figure was still above the year-earlier level, as the percentage of employed working-age women continued its secular uptrend.

Employment among teenagers declined throughout 1981, as it has every quarter since the end of 1979. These reductions stem largely from a diminishing population, but they also reflect a marked vulnerability to cyclical fluctuations. Being less skilled and lacking the work experience of adults, teenagers suffer greater employment declines in economic downturns than the other major age-sex groups. (See chart 1.) By the end of 1981, the teenage employment-population ratio had fallen nearly 3 percentage points from the fourth quarter 1980 level and more than 5 percentage points over the 2-year period.

Employment of black workers, at 9.3 million in the fourth quarter, was unchanged from a year earlier and, in fact, has fluctuated within the narrow range of 9.2 to 9.5 million since the last quarter of 1978, while the population for this group has continued to grow. As a result, the employment-population ratio for blacks declined 3 percentage points over the last 2 years, to 50.7 percent. Inadequate job growth has also affected whites, especially men, although to a considerably lesser extent. At 58.3 percent, the ratio for all whites was down slightly over the year, while their employment rose by 600,000.

The situation facing black teenagers grew bleaker in 1981, as their employment declined by 60,000 over the year to 480,000 in the last quarter. The result was a further decline in their employment-population ratio, from 23 to about 21 percent between the fourth quarters of 1980 and 1981. The ratio had been 25 percent in the late 1970's.[9] In contrast, almost half of all white teenagers were working in the last quarter of 1981.

Hispanic employment increased gradually over the year and by the fourth quarter was about 175,000 above the level of a year earlier. Gains were about equally split among men and women, while teenage employment was down slightly. However, these gains did not keep pace with the growth of the Hispanic population and their employment-population ratio declined 0.7 point during the year, to 56.9 in the last quarter.

Industry employment. During the first half of 1981, nonfarm payroll employment showed some improvement from the recessionary levels of 1980. However, employment growth slowed markedly during the third quarter. By the fourth quarter, the weakness which had been visible all year in the housing and automobile industries had clearly spread, and nonfarm employment dropped by almost half a million. (See table 5.) The Bureau of Labor Statistics' diffusion index of private nonagricultural payroll employment provides further evidence of the pervasiveness of the 1981 decline[10]. In the last quarter, job gains were registered in only one-third of the 172 industries included in the index, compared to more than three-fifths a year earlier.

Table 5. Nonagricultural payroll employment, seasonally adjusted quarterly averages, 1980–81

p = preliminary

The economy's slow recovery from the recession of 1980, which halted before all industries had rebounded fully, was largely due to the extremely high interest rates prevailing throughout most of 1981. The major victims of the 1980 recession were concentrated in the goods-producing sector—primarily in construction and automobile manufacturing and supplier industries tied to these two industries. As the cost of borrowing remained high, these highly interest-rate sensitive industries, after showing slightly higher employment in the first part of 1981, fell to more depressed levels than those experienced in 1980. The major source of employment strength during the year was generally in industries less sensitive to rising interest rates, such as services and mining. However, in the closing months of the year, the recession had begun to adversely affect virtually all industries. The goods-producing sector was clearly the hardest hit, notably manufacturing and construction. (See chart 2.) But even the service-producing sector felt the impact of the recession, as reflected in the considerably reduced pace of employment growth for some industries and sizable declines in the usually robust retail trade industry as the year drew to a close.

Employment in construction deteriorated significantly in 1981, following steady growth in the last half of 1980 and a modest increase in the first quarter. Mortgage interest rates remained high throughout most of the year, and the resulting sharp contraction in residential construction activity gave rise to steep job declines in construction employment. Housing starts, falling below 900,000 units in the last quarter, were the lowest since 1966; building permits, which provide an indication of future construction activity, declined steadily from April to November. By the third quarter of 1981, employment in the industry had plummeted to a level that was below its July 1980 recession low, and an additional 47,000 jobs were lost in the last quarter. The job loss totaled 192,000 from April's employment high. Moreover, the situation would have been worse were it not for relative continued strength in heavy construction.

After rising 350,000 in the first three quarters of 1981, the number of jobs in manufacturing declined by 500,000 in the final quarter to 20 million, almost 1.2 million below the all-time high reached in July 1979. More than two-thirds of this decrease was in durable goods, where every industry experienced a decline in employment in the fourth quarter. By December, durable goods manufacturing employment was 11.7 million, a level below its 1980 recession low.

The hardest hit manufacturing industry was transportation equipment, where the deterioration in the job situation has continued for nearly 3 years. After reaching a high of more than 2 million workers in early 1979, more than 330,000 jobs were lost by the end of 1981. The small recovery which took place in the first part of 1981 was due to automobile buyer and dealer incentive programs such as rebates, discounts, and low-interest financing that served to temporarily boost sales; however, automobile sales virtually collapsed in the fourth quarter, forcing automobile manufacturers to slash production and layoff workers. As a result, automobile employment fell by more than 50,000 in the final quarter. These declines, in turn, meant a drop in orders for a number of other manufacturing industries, ranging from primary and fabricated metals to textiles and rubber and plastics. With reduced orders and rising inventories, sharp cutbacks in industrial production were soon evident throughout durable goods manufacturing and among nondurable goods industries as well.

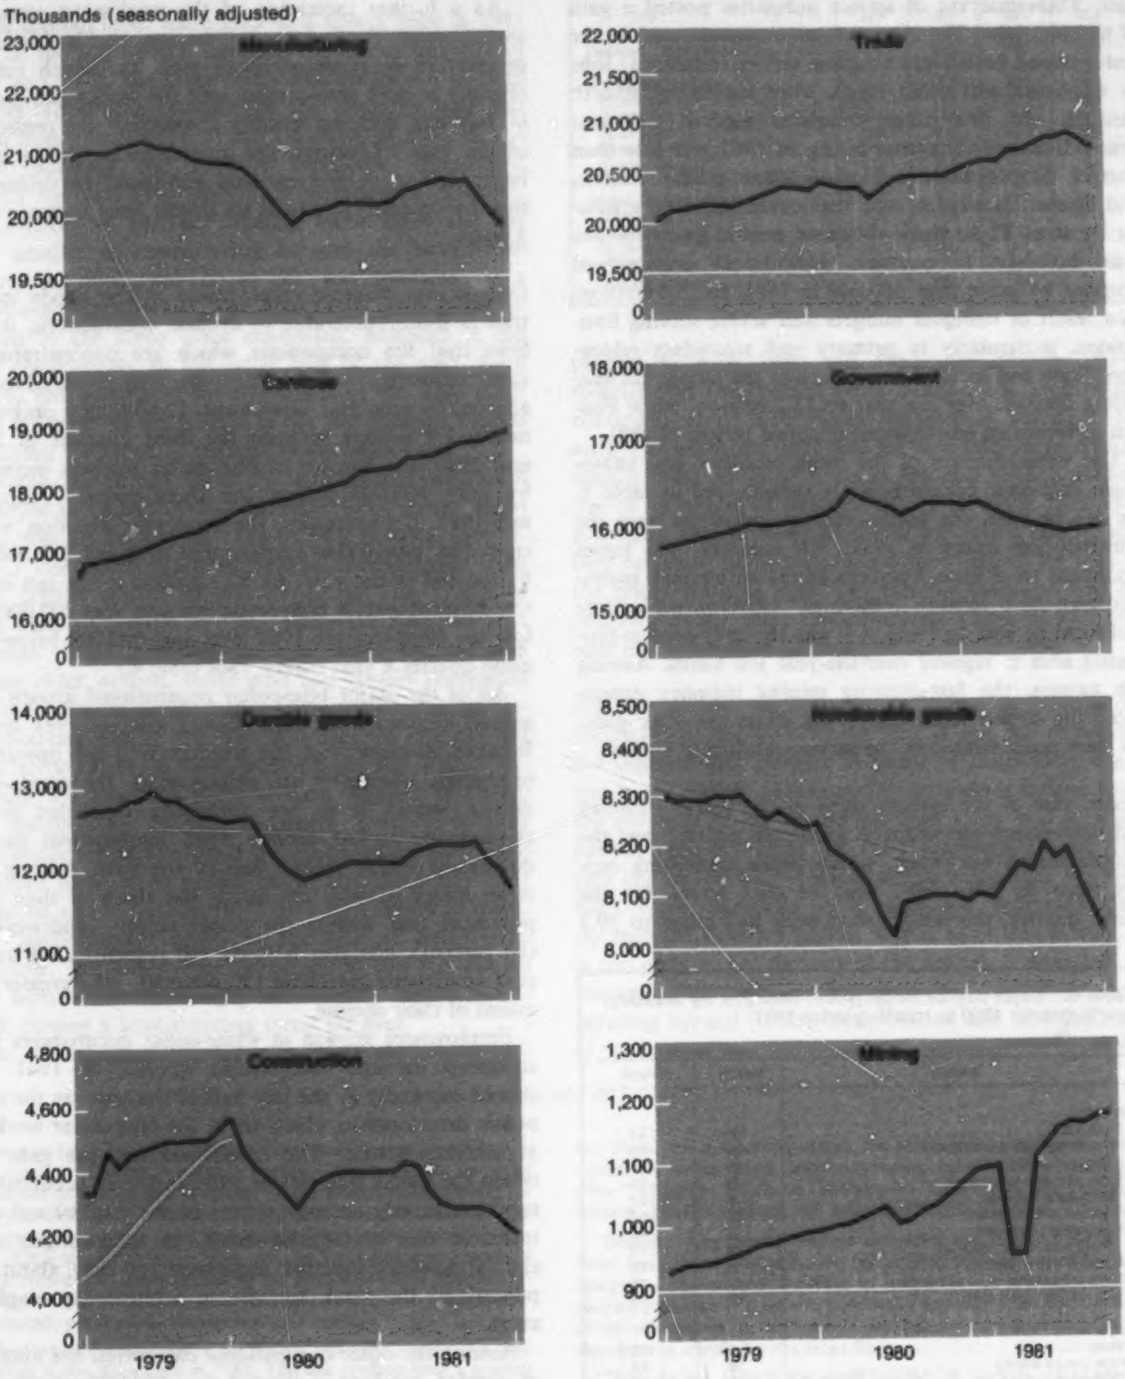
With the prolonged slump in housing activity, there were also sizable cutbacks in industries heavily dependent upon construction activity. Most notably, employment in lumber and wood products slipped significantly during the year, falling to a level 24,000 below its June 1980 recession low. Stone, clay and glass and major appliances—which are closely tied to construction activity —also witnessed significant declines over the year. (See table 5.)

Employment in nondurable goods manufacturing rose in the first 3 quarters of 1981 but then dropped sharply in the final quarter. The largest cutback occurred in food processing, which has been following a long-term downtrend. Conversely, the only major nondurable industry to post a significant increase for the year was printing and publishing; this industry had also been largely unaffected by the 1980 downturn, possibly because of its strong ties with the less-cyclically vulnerable service-producing sector.

In marked contrast to the job declines registered in construction and manufacturing, mining grew rapidly in 1981, sustaining the pattern of growth that began in the aftermath of the 1973 oil embargo. While representing slightly more than half of the employment in the industry division, the oil and gas extraction industry accounted for more than 90 percent of the job gains during the year, a reflection of the rapid expansion in exploration and development activity. Despite a slight drop in employment in the second quarter, relating to temporary losses that stemmed from a coal strike, mining industry employment rose at a faster rate than any other nonfarm industry, climbing 11.3 percent in 1981. (See chart 2.)

Employment in the service-producing sector expanded throughout 1981, more than offsetting the employment decline in the goods sector. However, as evidence that the sector is not totally immune to recessions, the rate of increase was significantly below that witnessed during the few years just prior to the 1980 and 1981 recessions. The number of jobs rose by 860,000 from the fourth-quarter 1980 level to 66.1 million at the end of

Chart 2. Nonfarm payroll employment by selected industries, 1979-81



Note: Data for November and December 1981 are preliminary.

1981. The advance was dominated by increases in the division comprising such diverse industries as legal, health, business, and educational services, hotels and other lodging, amusement and recreation, and auto repair. This amalgam of service industries posted a gain of 660,000 jobs. The increases were concentrated in the fast-growing health and business service industries. Jobs in wholesale and retail trade, after sustaining growth through the first three quarters, tapered off near yearend, as pre-Christmas hiring in 1981 was less than normal. Employment in transportation, public utilities, and finance, insurance, and real estate followed a similar pattern. These three divisions posted gains for the year, however. In contrast, government employment dropped by more than 300,000 in 1981, to 15.9 million, as a result of stringent budgets and severe staffing limitations, particularly in primary and secondary education. State and local government had the largest decline, falling 260,000 over the year to 13.2 million, while Federal government employment dropped almost 50,000.

The varied impact of the weak recovery and subsequent economic contraction are summarized in table 6. As can be seen, the goods-oriented industries were the principal job losers in 1981. For example, job losses amounted to at least 7 percent in the automobile manufacturing and lumber industries. Government—State and local as well as Federal—was the only service-producing area to register over-the-year job losses. Among job gainers, the fast-growing mining industry experienced the largest relative increase, while the other gainers were concentrated in the service-producing sector.

Hours. One of the earliest signs of the stifled recovery and subsequent downturn in economic activity was the manufacturing workweek, which began decreasing rapidly from its May 1981 peak of 40.3 hours. By the fourth quarter, the factory workweek had fallen to 39.3 hours, only 0.1 hour above its 1980 recession low. Factory overtime hours, which were largely responsible for the decline in the manufacturing workweek, had declined by 0.7 hour to 2.5 hours by the end of the year.

Table 6. Major payroll employment changes, by industry, fourth quarter 1980 to fourth quarter 1981

[Numbers in thousands]

Industry	Number	Percent
Job losers:		
Construction	−159	−3.6
Residential building construction	−32	−5.3
Lumber and wood products	−48	−7.0
Stone, clay, and glass products	−23	−3.5
Primary metal industries	−36	−3.2
Fabricated metal industries	−35	−2.2
Transportation equipment	−77	−4.2
Motor vehicles and equipment	−55	−7.4
Food and kindred products	−33	−1.9
Textile mill products	−21	−2.5
State and local government	−262	−1.9
Job gainers:		
Mining	119	11.3
Printing and publishing	36	2.8
Retail trade	305	2.0
Finance, insurance, and real estate	124	2.4
Services	663	3.7

As a further indication of the weakening economic environment, the index of aggregate weekly hours for production or nonsupervisory workers, which reflects changes in both employment and the workweek, peaked in July and declined steadily throughout the remainder of the year.[11] Likewise, the manufacturing hours index began falling at midyear and continued to decline so that by yearend, it was at its lowest level in more than 5 years.

Occupations. Because employment in the goods industries is more vulnerable to cyclical contractions, it follows that the occupations which are concentrated in these industries—blue-collar—are also more adversely affected by economic downturns. Exhibiting a decline of nearly 1.9 million between the third quarters of 1979 and 1980, the number of blue-collar workers increased by only 800,000 during the short recovery through mid-1981. Subsequently, the economic situation worsened and blue-collar employment dropped 1.0 million by the end of the year. At 30.7 million in the last quarter, employment of blue-collar workers was 200,000 below the third-quarter 1980 level and 600,000 below the same quarter a year before. (See table 4.)

All of the major blue-collar occupational groups registered declines from their second quarter 1981 levels. Because 80 percent of the workers who are operatives (excluding transport) are employed in the goods-producing sector, it is not surprising that this group showed the largest decline when employment turned downward in the second half of the year. Among the other major groups, the larger the share of their employment that was in the goods sector—craftworkers (60 percent), nonfarm laborers (40 percent), and transport equipment operatives (30 percent)—the greater the extent of their decline.

Employment growth in white-collar occupations was sustained through the second quarter of 1981 but slowed markedly in the last half of the year, as the economic deterioration which set in for blue-collar workers at midyear spread. The 850,000-million job gain between the fourth quarters of 1980 and 1981 occurred almost exclusively among persons in the professional and technical and managerial fields, as salesworkers and clerical workers together accounted for only about 10 percent of the total increase in white-collar employment.

Among the other occupational categories, the number of service workers increased by 400,000 above the fourth quarter 1980 level, while the number of farmworkers, which had been on a slow downtrend throughout the postwar period until the late 1970's, showed little movement.

The labor force

The civilian labor force grew at a slower pace in 1981 than in the late 1970's. Between the fourth quarters of 1980 and 1981, the labor force was up by 1.6 million, slightly above the increase of the previous year but down from increases of about 3 million or more in the years following the 1973–75 recession. Diminished growth has not been altogether unexpected, however. The number of persons reaching labor force age has been smaller in recent years because the baby-boom generation, now aged 20 to 30, was followed by a "baby-bust" generation. The growth in the number of women in the labor force continued, although it did slow considerably in the latter half of the year. Such growth still accounted for two-thirds of the total labor force increase. At 6.9 million in the last quarter, women accounted for about 43 percent of the work force.

Overall, the percentage of the working-age population employed or unemployed—the labor force participation rate—was up slightly in 1981 to 63.9 percent. (See table 7.) The participation of women has increased from rates slightly above 30 percent in the late 1940's to more than 52 percent in 1981, while the rates for men declined. Early postwar increases were concentrated among older women, those who had largely completed the time-consuming portion of their child-rearing responsibilities. But in the past two decades, the greatest labor force increases have occurred among women under age 35. Many of these women delayed marriage, and childbearing, to pursue careers. Even when they had children, many retained their jobs rather than leave the labor force, as in earlier times. The trend may have gotten an added push in the 1970's by a desire to maintain family buying power in the face of inflationary pressures. The labor force participation rate for women near normal retirement ages has recently turned downward, joining a long-standing trend for men.

The participation rate for men, down slightly to 79.0 percent between 1980 and 1931, has declined fairly steadily over the postwar years, primarily a result of the continued early labor force withdrawal among older men. For example, there was an especially large decline among those 55 to 64 years in the past decade, indicative of an improved financial ability to retire. Participation rates have actually increased for young adults, and they remained quite high (and little changed) for men in the prime working ages. The rate for teenagers had increased steadily since 1965, reaching a high of 57.9 percent in 1979, before declining in the last 2 years.

Table 7. Labor force participation rates for selected demographic groups, annual averages, 1951–81

	1951	1961	1971	1981
Total	59.3	59.3	60.2	63.9
Teenagers, 16–19 years	52.2	46.9	49.7	55.4
Men, 20 years and over	88.2	85.7	82.1	79.0
20–24 years	88.4	87.8	83.0	85.5
25–34 years	96.9	97.5	95.9	94.9
35–54 years	96.8	96.6	95.2	93.5
55–64 years	87.2	87.3	82.1	70.6
65 years and over	44.9	31.7	25.5	18.4
Women, 20 years and over	34.0	38.0	43.3	52.1
20–24 years	48.5	47.0	57.7	69.6
25–34 years	35.4	36.4	45.6	66.7
35–54 years	39.7	46.8	52.9	64.2
55–64 years	27.6	37.9	42.9	41.4
65 years and over	8.9	10.7	9.5	8.0

AS 1981 ENDED, the country was mired in a recession, the eighth in the post-World War II era. All recessions are separate and distinct in terms of magnitude, duration and breadth. However, this episode is unique from the previous seven by the fact that there was a rather limited recovery from its 1980 predecessor, and that two key industries—notably construction and automobile—were essentially in a continued depressed state through the recovery period. While, as of this writing, it is too early to see the end of the tunnel, it was clear at yearend that most leading economic indicators were pointing toward further deterioration and that industrial production was still heading downward. ☐

FOOTNOTES

[1] Data on labor force, total employment, and unemployment are derived from the Current Population Survey (CPS), a sample survey of households conducted and tabulated by the Bureau of the Census for the Bureau of Labor Statistics. Statistics on nonagricultural payroll employment and hours from the Current Employment Statistics Program (CES) are collected by State agencies from employer reports of payroll records and are tabulated by the Bureau of Labor Statistics. A description of the two surveys appears in the Bureau of Labor Statistics monthly publication, *Employment and Earnings*.

[2] The proportion of blacks in the "black and other" group has been declining; it was 83 percent in 1980. This has resulted from a gradual influx of Asians, particularly Vietnamese, into the U.S. labor force in the 1970's. For this reason, and because of the availability and increased reliability of data for blacks, it is not as necessary as in the past to use data for "black and other" when discussing black workers. Thus, unless otherwise stated, the term black in this article refers exclusively to the "black only" population and not to the "black and other" category, which, in addition to blacks, includes American Indians, Alaskan Natives, and Asian and Pacific Islanders.

[3] Because of movement between industries and into and out of the labor force, unemployment rates by detailed industry are difficult to interpret. For example, a decline in joblessness among workers in a particular industry does not necessarily indicate the reemployment of laid-off workers. It could mean that these workers have found work elsewhere or simply left the labor force.

[4] Data do not include the small number of workers on shortened workweeks because of material shortages and those who began or ended a job during the survey week.

lence and duration," *Monthly Labor Review*, July 1980, pp. 3–12.

[6] For futher detail on this subject, see Paul O. Flaim, "Discouraged workers and changes in unemployment," *Monthly Labor Review*, March 1973, pp. 8–16, and Carol M. Ondeck, "Discouraged workers' link to jobless rate reaffirmed," *Monthly Labor Review*, October 1978, pp. 40–42.

[7] For a discussion of the employment-population ratio as a cyclical indicator, see Carol Boyd Leon, "The employment-population ratio: its value in labor force analysis," *Monthly Labor Review*, February 1981, pp. 36–45, and Julius Shiskin, "Employment and unemployment: the doughnut or the hole?" *Monthly Labor Review*, February 1976, pp. 3–10.

[8] For a discussion of the relative impact of recessions on different demographic groups, see Norman Bowers, "Have employment patterns in recessions changed?" *Monthly Labor Review*, February 1981, pp. 15–28.

[9] The employment-population ratio for black and other youth was down about 13 points over the past quarter century.

[10] For a detailed discussion of indexes of diffusion of changes in the number of employees on nonagricultural payrolls, see John F. Early, "Introduction of Diffusion Indexes," *Employment and Earnings*, December 1974, pp. 7–11.

[11] Aggregate hours is a joint measure of the change in both hours and employment. For basic industries, aggregate hours are the product of average weekly hours and production-worker or nonsupervisory-worker employment.

The role of apprenticeship

Apprenticeship is only one of the many ways in which a vocational aptitude may be gained. In most occupations, training is acquired on the job, in trade or vocational schools, in the Armed Forces, or in Federal or State training courses, or principally by 'picking up the trade'—that is, working with journeymen on a variety of jobs until proficiency is achieved. Only about one-fourth of all unions actually participate in apprenticeship regulation. Moreover, most employees who do work in apprenticeable trades have learned their trade without having served an apprenticeship. Thus, studies have estimated that as many as 80 percent of all carpenters and 30 percent of all electricians became journeymen without serving apprenticeships. These studies also show that it is more difficult to become a journeyman in the electrical, mechanical, and plumbing trades without formal training than in the carpentry, painting, and trowel trades (bricklaying, cement finishing, and so on).

Inc., 1981), p. 228.

New worklife estimates reflect changing profile of labor force

The worklife expectancy of men continued to level off between 1970 and 1977, while that of women increased significantly

SHIRLEY J. SMITH

The Bureau of Labor Statistics has developed a new set of working life tables based on labor force patterns observed in 1977. On the basis of these patterns, the Bureau estimates that the average man 16 years of age can expect to spend 38.5 years in the labor force while a typical woman of that age can expect 27.7 years of labor force involvement.

Patterns of lifetime labor force attachment for both men and women are constantly changing. Comparisons of labor force participation rates from year to year suggest evolving patterns of labor force entry and withdrawal, as well as significant changes in economic activity at midlife. However, it is difficult to identify the current "lifetime pattern of labor force involvement" from these rates alone.

Working life tables were developed to isolate such lifetime patterns. The results of the model are synthetic. That is, they summarize the behavior of all age groups in the population during a given year, rather than trace the history of any one group through its lifetime. The tables estimate how frequently members of a population would enter and leave the labor force, and how long the average person would remain economically active, if rates of behavior remained as they were in the reference year.

Recent participation trends affect methodology

Of course, these rates do not remain constant over time. In fact, activity rates of men and women have changed substantially since 1970, the reference year of the Bureau's previous working life tables. Between 1970 and 1977, the entire cross-sectional profile of participation for both sexes changed. (See table 1.) Persons age 16 to 24 became increasingly active; those above age 55 showed a weakening attachment to the labor force. The participation rates of younger women showed the most remarkable change, increasing by more than one percentage point per year. The rate for those 25 to 34 increased by 14.5 percentage points in just 7 years. At the same time, rates of older persons were dropping, with that of men 60 to 64 declining by 12.1 percentage points.

In the prime working ages, the labor force attachment of men slackened somewhat, while that of women increased substantially. The net effect was a decline in the mean age of labor force members, reinforcing the drop related to the age structure of the population itself. The magnitude and character of these changes have rendered the 1970 worklife estimates obsolete.

Shirley J. Smith is a demographic statistician in the Division of Labor Force Studies, Bureau of Labor Statistics.

Table 1. Civilian labor force participation rates by sex and age, annual averages, 1970 and 1977

Age	Men		Change	Women		Change
	1970	1977	1970–77	1970	1977	1970–77
16–19	56.1	61.0	4.9	44.0	51.4	7.4
20–24	83.3	85.7	2.4	57.7	66.5	8.8
25–34	96.4	95.4	–1.0	45.0	59.5	14.5
35–44	96.9	95.7	–1.2	51.1	59.6	8.5
45–54	94.2	91.2	–3.0	54.4	55.8	1.4
55–59	89.5	83.2	–6.3	49.0	48.0	–1.0
60–64	75.0	62.9	–12.1	36.1	32.9	–3.2
65 and over	26.8	20.1	–6.7	9.7	8.1	–1.6

Moreover, there is now much evidence that adults, particularly women, move in and out of the labor force repeatedly during their lifetimes. This movement contradicts a basic assumption of conventional worklife methodology, that workers remain in the labor force continuously from age of entry to age of final withdrawal. The growing conflict between model and reality appears to have adversely affected estimates published for the years 1950–70.

The new worklife estimates for 1977 are drawn from a dynamic new model known as the increment-decrement working life table. This model is markedly different from the original (or conventional) worklife technique used to produce the estimates previously published by the Bureau. The new values are not entirely comparable with previously published figures,[1] because they reflect not only changes in the behavior of American adults, but also several fundamental changes in modeling procedures.[2]

The key feature of this model is that it rests on observed probabilities of movement into and out of the labor force—a flow variable, rather than labor force participation rates, which are a measure of stocks. In the new tables, persons are assumed to pass through life, at each age facing the "probabilities of transition" observed for that age group in the base population during the reference year. Worklife expectancies summarize the length of time the average adult would spend in the labor force during his or her lifetime, if these probabilities did not change. Rates of labor force accession and separation summarize the volume of labor turnover which would occur within each age group if mobility patterns remained constant.

Unlike previously published estimates for women, the new tables do not spell out expectancies separately by marital or parental status. Such tables imply a fixed status for life. Instead, the new model presents a summary table for all women. The transition probabilities underlying this table reflect the impact of normal life cycle changes on labor force attachment at each age.

For purposes of comparison, 1970 estimates have been reestimated using the new increment-decrement methodology. Selected revised values are included in this report.

New estimates and trends in worklife expectancy

Tables of working life for 1977, estimated by the increment-decrement method, indicate that given a continuation of mortality and labor force behavior observed at that time, a boy born in 1977 was likely to spend 37.9 years in the labor force and a girl, 27.5 years. (See table 2.) Those surviving to age 16 would have slightly higher average worklife expectancies—38.5 and 27.7 years, respectively. At age 50, the average man could anticipate 11.7 more years of labor force involvement, the average woman, 7.5 years.

Within any age group, persons currently active have a higher worklife expectancy than those not in the labor force. Although previous studies have hinted at this relationship, the new estimates for the first time spell out the magnitude of the differential. Among teenagers it is relatively small; most are likely to enter and leave the labor force repeatedly before settling into adult roles. However, at midlife the active and inactive groups are no longer so similar. For those not in the labor force, the probability of reentry declines with age. At age 45 the active group is expected to work about 4 years longer than its inactive counterpart.

Historic comparisons of the worklife index are impeded by the fact that patterns of labor force attachment have changed, forcing a revision in methodology. During the first half of this century, when worklives tended to be more continuous, the conventional model gave relatively unbiased estimates of their duration. However, as work patterns became increasingly irregular after World War II, the quality of the estimates declined. The problem was greatest for groups having high rates of labor turnover. For such groups, the conventional model tended to underestimate the size of the labor force, and to overstate the average worklife duration. Estimates for women workers were especially tenuous,

Table 2. Worklife expectancies of the population and of active and inactive persons by age and sex, 1977

[In years]

Age	Men			Women		
	Total	Active	Inactive	Total	Active	Inactive
At birth	37.9	—	37.9	27.5	—	27.5

growing increasingly biased from 1950 to 1970. Only the 1970 values have been reestimated using the increment-decrement model. Conventional estimates for 1950 through 1970 seriously overstate work durations for women in the labor force during that period. When these data are excluded, however, the results of previous models give a credible picture of the evolution of labor force attachments in this century. (See table 3.)

In 1900, the life and worklife expectancies of men were very similar. At age 20, the average man could expect to spend only 4.4 years outside of the labor force. During the next 77 years, men's life span increased by 23 years, with the bulk of the increase—about 17 years—going into nonlabor force activities. The growth in worklife expectancy was less than 6 years. Between 1970 and 1977, virtually the entire increase in life expectancy (2.2 years) went to nonlabor force activities. At the turn of the century, the average man spent 69 percent of his lifetime in the labor force, but by 1977, this figure had dropped to about 55 percent.

In contrast, the formal worklife of women has increased dramatically during this century. In 1900, women averaged little more than 6 years of formal labor force involvement. Over the next 77 years, their average life span increased by almost 29 years, of which 21 were allocated to labor market activities. The shift has been especially pronounced in recent years. Between 1970 and 1977, worklife durations rose by 5 years, while life expectancy increased by only 2.3 years. This was accomplished by a reallocation of time—nearly 3 years per woman—from home to labor market activities. At the turn of the century, women spent an average of 13 percent of their lifetimes in the labor force, compared to nearly 36 percent in 1977.

Because of these countervailing trends, the worklife durations of men and women have been converging. It is estimated that in 1940, the average expectation of working life for young women was just 30 percent of that for men. By 1970, it was 57 percent and by 1977, it represented 71 percent that for men. While these figures do not take account of differences in hours worked, an important distinction, they do illustrate how fundamentally the roles of men and women have changed.

Measures of labor force mobility

A second function of the working life table is to quantify movements into and out of the labor force. The conventional model derived aggregate estimates of these flows from age-to-age comparisons of labor force participation rates. The results, taken to describe net flows, gave little insight into the process of labor turnover. The new model rests on observed probabilities of labor force entry and exit at each age. It estimates both net and gross rates of mobility, and provides information on the frequency and timing of these movements in the average person's life.

The new estimates indicate that most people establish their first contact with the labor force as teenagers. In the 1977 life table population, half of all young men had become members of the labor force by age 16.4. (See table 4.) The median age of first entry for women was marginally higher, 16.6 years. Because entries and reentries occur at all ages, the mean age of male labor force entrants was 26.9 years, and that of female entrants was even higher, 28.7 years.

Given a continuation of the work life patterns observed in 1977, it is estimated that the average man would enter the labor force 3 times in his lifetime. The average woman would do so 4.5 times. Men are likely to complete the phase of intermittent work more quickly than women. At age 25, they would anticipate an average of just 1.1 more labor force entries, while women could look forward to 2.7 additional entries.

According to the 1977 tables, men would average 12.6 years of labor force involvement for every entry during their lifetime. The average duration per entry for women was expected to be less than half this figure, or 6.1 years. Because most men were firmly attached to the job market by age 25, they would spend an average of 29.1 years in the labor force for every entry beyond that age, but the typical woman would engage in several shorter periods of activity, averaging just 8.6 years per entry.

Table 4. Selected indexes of working life by sex, 1970 and 1977

Worklife measure	Men		Women	
	1970	1977	1970	1977
Median age at first labor force entry	16.5	16.4	16.8	16.6
Mean age of all first and repeat labor force entrants	26.6	26.9	29.2	28.7
Worklife expectancy (in years):				
At birth	37.8	37.9	22.3	27.5
At age 25	34.4	33.4	19.0	23.0
Number of labor force entries per:				
Person born	2.9	3.0	4.6	
Person age 25	1.2	1.1	2.8	4.5 2.7
Expected duration in labor force per entry remaining (in years):				
At birth	13.0	12.6	4.8	6.1
At age 25	29.4	29.1	6.8	8.6
Number of voluntary exits from labor force per:				
Person born	2.6	2.7	4.5	4.4
Person age 25	1.9	2.0	3.3	3.3
Percent of workers expected to die while in the labor force	36.3	27.0	10.8	9.5
Mean age of all persons leaving the labor force:				
Total first and repeat exits	38.7	38.7	33.5	33.9
Voluntary withdrawals	36.1	37.0	32.9	33.4
Deaths of workers	57.3	55.6	58.1	56.3
Median age of persons leaving labor force at age 50 and above	65.0	63.4	61.4	60.6

Table 5. Population-based rates of labor force accession and separation by age and sex, 1977

[Per 1,000 persons in the stationary population]

Age	Accessions		Separations		Net flow	
	Men	Women	Men	Women	Men	Women
16–19	211.8	207.2	124.3	127.9	87.3	79.3
10–24	136.3	158.3	93.9	142.0	42.5	16.2
25–29	54.4	109.6	38.6	116.0	15.8	–6.5
30–34	23.8	88.4	23.0	84.1	0.8	4.3
35–39	14.9	75.2	17.6	73.5	–2.7	1.7
40–44	15.5	66.3	21.6	69.0	–6.1	–2.7
45–49	16.4	57.9	28.2	68.1	–11.8	–10.2
50–54	17.1	46.8	37.1	63.7	–20.0	–16.9
55–59	19.1	37.4	56.3	66.2	–40.2	–28.8
60–64	30.8	32.0	113.1	77.8	–82.3	–45.8
65–69	44.5	27.8	92.9	52.2	–48.4	–24.4
70–74	35.7	16.1	56.3	27.1	–20.6	–11.1

Working life tables show two forms of labor force withdrawal: voluntary separation and death. Given the work and mortality patterns of 1977, the average young man could expect to leave the labor market voluntarily 2.7 times. About 27 percent of men would die before reaching retirement. The average young woman was likely to leave the labor force voluntarily 4.4 times, and fewer than 1 in 10 were likely to die before retiring.

Because the age distribution of labor force withdrawals is bimodal, with heavy outflows at both ends of the age spectrum, the mean age of all exits (38.7 years for men and 33.9 years for women) tells us little about final retirement. It is very difficult to identify retirement norms, because the retiree can and often does reenter the labor force. However, the 1977 tables indicate that among persons leaving the labor market at or beyond the age of 50, the life table median age of exit was 63.4 years for men, and 60.6 years for women. It appears that the age at retirement has dropped for both sexes since 1970. This may help to explain the concurrent drop in proportions likely to die as members of the labor force.

At the aggregate level, the new tables show a much greater volume of movement in and out of the labor force than has been quantified in the past. Although men and women in their teens have roughly comparable rates of labor force entry and withdrawal, the retention of young men exceeds that of women in this age group. (See table 5.) The pace of labor force entries for both sexes slows by age 20. However, as men begin to settle into their role as workers—as evidenced by a drop in their separation rate—female labor force exits actually rise. By age 25, the share of all men in the labor force substantially exceeds that of all women. Because a larger proportion of the female population remains outside the job market but may enter at any time, the accession rates of women are greater than those of men throughout midlife. Net retirements peak between the ages of 60 and 64. Thereafter, men are more likely than women to reenter the labor force. The rise in male entry rates at age 60 highlights the fact that retirement is often a temporary state.

The separation rates shown in table 5 are expressed as a ratio of withdrawals to population. A more common form is the ratio of withdrawals to labor force members. (See table 6.) Changing the denominator in this way has little effect on the rates of separation for prime working-age men, because most members of this population are also in the labor force. However, because of the disparity between population and labor force counts for other groups, the change to a labor force base inflates the rates of these other groups. This gives a better illustration of their relative propensities to leave the job market. Among persons working in the prime ages, women are as much as five times more likely than men to withdraw from economic activity. Only at age 65 and above do working men show a greater propensity to retire.

Trends in mobility rates

The pace of net labor force entries for young people increased markedly between 1970 and 1977. (See table 7.) Although the gross accession rates of teenagers rose slightly during this period, they had less bearing on the net influx than did the drop in labor force withdrawals. As young people showed increasing reluctance to leave the job market, the process of labor force expansion with age became more efficient. At the same time, the pace of net labor force withdrawals among persons age 45 and older accelerated. The separation rates of men 45 to 64 increased sufficiently to outweigh (and perhaps to have caused) slight increases in labor force entries. The increased frequency of retirement in these age groups contributed to a drop in participation rates.

Table 6. Labor force based rates of separation by age and sex, 1977

[Per 1,000 workers in the stationary labor force]

Age	Men	Women
16–19	254.7	290.5
20–24	125.0	226.3
25–29	42.7	182.9
30–34	24.3	134.7
35–39	18.5	112.8
40–44	22.9	105.3
45–49	30.5	107.7
50–54	42.1	110.8
55–59	74.6	136.2
60–64	209.7	251.3
65–69	376.2	369.7
70–74	441.9	388.7

Table 7. Comparison of labor force mobility ratas by age and sex, 1970 and 1977

[Life table rates per 1,000]

Sex and age	Accessions in population		Separations in labor force		Net flows in population

30–34	90.7	88.4	206.3	134.7	–1.1	4.3
35–39	83.7	75.2	162.6	112.8	7.2	1.7
40–44	72.3	66.3	132.7	105.3	4.7	–2.7
45–49	60.3	57.9	121.9	107.7	–2.9	–10.2
50–54	48.7	46.8	115.4	110.8	–8.7	–10.9
55–59	43.3	37.4	131.5	136.2	–17.4	–28.8
60–64	38.9	32.0	200.8	251.9	–33.0	–45.8
65–69	29.4	27.8	308.9	369.7	–33.4	–24.4
70–74	16.0	16.1	402.8	388.7	–19.2	–11.1

The situation for women was more complex. They too showed a rise in net labor force separations between the ages of 45 and 64. However, the increased net outflow of those 45 to 54 was evidence of a tightening, rather than a loosening of female labor force attachments. Below the age of 55, working women showed a drop in propensity to leave the job market. The slowdown of youthful separations limited the size of the labor reserve from which to draw older entrants. Hence, entries at midlife also declined. The decrease in labor turnover led to higher participation rates for women 45 to 54. Nonetheless, the share of women attached to the labor force, and at risk of leaving, had increased. Between 1970 and 1977, the ratio of withdrawals to population increased, and with it net labor force losses for women in this age range. Only among women over 55 is there evidence that intentions to retire were becoming stronger. Within this group, an increase in separation rates was accompanied by a drop in rates of labor force reentry.

THE WORKLIFE EXPECTANCIES of men and women in the United States have been converging since the end of World War II. This trend accelerated between 1970 and 1977, primarily because of the strengthening of female labor force attachments. Although the average worklife duration of men remained nearly constant, that for women increased by about 12 years. There remained significant differences in time allocation by sex; women were far more likely than men to withdraw from and reenter the labor force at midlife. Nevertheless, by 1977, women spent an average of 70 percent as many years in the labor force as did men.

The new worklife model quantifies a substantial flow of persons into and out of the labor force for both sexes at every age. The pace of entries for teenagers increased between 1970 and 1977. For men 20 to 34, and for most women above age 20, entries actually slowed. However, a greater drop in withdrawals brought about the net expansion of the labor force seen as increased participation rates for many age groups during this period.

The complete increment-decrement working life tables for men and women, 1970 and 1977, are available upon request from the Bureau of Labor Statistics and will appear in reprints of this article. ☐

A centennial view

The AFL and a national BLS: labor's role is crystallized

From the labor federation's first convention in 1881 to the establishment of the Labor Department in 1913, relations between the union movement and the BLS often were influenced by the needs of the times and by the personalities of Samuel Gompers, and Commissioners Carroll Wright and Charles Neill

Joseph P. Goldberg and William T. Moye

The American trade union movement, which last year celebrated the centennial of its founding, and the Bureau of Labor Statistics, which soon will observe its own 100th anniversary, grew up together, sometimes in confrontation, but more often in mutual—though distant—respect. The relationship between the American Federation of Labor and the Bureau was affected both by the needs of the times and by the personalities of the leaders, AFL President Samuel Gompers and BLS Commissioners Carroll D. Wright and Charles P. Neill.

This article reports on some of the common and divergent interests of the two organizations, from their beginnings until 1913, when BLS became part of the present Department of Labor.

Campaign for a bureau

The convention in 1881 of the Federation of Organized Trades and Labor Unions of the United States and Canada, which marks the centennial beginning of the AFL–CIO, included in its statement of principles and action a call for a national Bureau of Labor Statistics:

> **". . . we recognize the wholesome effects of a Bureau of Labor Statistics as created in several States, and we urge upon the Congress the passage of an act establishing a national Bureau of Labor Statistics, and recommend for its management the appointment of a proper person identified with the laboring classes of the country."[1]**

Earlier, the short-lived National Labor Union had called for a Department of Labor in 1867. By 1878, when the Knights of Labor called for national and additional State bureaus of labor statistics, Massachusetts (1869), Pennsylvania (1872), Missouri (1876), and Ohio (1877) had established such bureaus.[2]

The efforts of the labor organizations, and the growing awareness of the national political parties of the potential governmental influence of labor and the socio-

Joseph P. Goldberg is special assistant to the Commissioner of Labor Statistics. William T. Moye is a historian in the Office of Publications.

economic effects of industrial growth, culminated in the establishment of a Bureau of Labor within the Department of Interior in 1884. The uncertainty of Federal policies during this period resulted in metamorphoses of the agency as an autonomous, but non-Cabinet-level Department of Labor from 1888 to 1903; combination with other agencies in the new Cabinet-level Department of Commerce and Labor in 1903; and ultimately transference to the new Department of Labor in 1913.

Samuel Gompers, along with other union officials, strongly supported the establishment of a national Bureau in the Senate hearings on Capital and Labor in 1883. He felt that there had been excessive pleading of ignorance by Congress of workers' conditions to justify Congressional inaction on labor matters. A national Bureau "would give our legislators an opportunity to know, not from mere conjecture, but actually, the condition of our industries, our production, and our consumption, and what could be done by law to improve both [sic]." He cited the useful role of existing State statistical agencies as exemplified by a recent investigation of factory working conditions by the Massachusetts Bureau of Labor under the direction of Carroll D. Wright.[3]

Wright also appeared as an expert witness at the hearings, providing a look at such a bureau's role, which largely paralleled Gompers' view. He had administered the State bureau "as a scientific office, not as a Bureau of agitation or propaganda, but I always take the opportunity to make such recommendations and draw such conclusions from our investigations as the facts warrant." He stressed the need for Federal "investigations into all conditions which affect the people, whether in a moral, sanitary, educational, or economic sense," and thus "add to the educational forces of the country a sure and efficient auxiliary." He saw the resultant statistical progress of the Nation as indicating "its great progress in all other matters."[4] This background and philosophy were major factors in Wright's subsequent appointment as U.S. Commissioner of Labor.

In 1884, backed by the then powerful Knights of Labor and the newly organized Federation, the establishment of a national Bureau was part of both parties' platform.[5] In that same year, overwhelming majorities in both houses of Congress voted to establish the Bureau of Labor in the Department of the Interior. Approved by President Chester Arthur on June 27, the action provided for a Commissioner of Labor appointed by the President for a 4-year term. The Commissioner's mission was to "collect information upon the subject of labor, its relation to capital, the hours of labor and the earnings of laboring men and women, and the means of promoting their material, social, intellectual and moral prosperity." After considering several candidates, President Arthur finally appointed Wright, whom the Senate confirmed about 6 months after the act's passage.[6]

Wright swiftly established professionalism and impartiality in the national Bureau, as he had in Massachusetts. Striving to obtain labor interest, he invited Gompers and other delegates to visit the Bureau during the 1885 Federation convention. Gompers had known Wright for years, and had long been actively interested in the role of government labor agencies. The two men had previously discussed the plans and methods of the newly established New York State Bureau of Labor Statistics. Their meeting left mutual favorable impressions.[7] The Bureau's value was further confirmed by the Commissioner's first annual report, a comprehensive treatment of the causes of the depression of 1882–86. The study was included in Gompers' periodic references to the intensification of the displacement of manual labor by machinery over the years.[8] While the report noted the advantages of mechanization, it also asserted that the effect of the temporary displacement of labor was to assist "in crippling the consuming power of the community."[9] Among the remedies suggested for coping with the depression, Wright included some general proposals suggesting that capital and labor "each shall treat with the other through representatives" in disputes, and that "the party which declines resort to conciliatory methods of arbitration [is] morally responsible for all ill effects growing out of the contest."[10]

The growing status of the Bureau, and a campaign by the still powerful Knights of Labor resulted in the transformation of the Bureau in 1888 into an independent Department of Labor, without Cabinet status. Reflecting Wright's concerns, the enabling act specifically called for studies of: the domestic and foreign costs of production of dutiable goods for the ongoing tariff debates, national trade and industrial production, the causes and circumstances of strikes, and other special topics. The basic functions of the agency had not changed, but for 15 years it was more independent. Moreover, Congress, in a separate statute relating solely to railroad disputes (Arbitration Act of 1888), had authorized the President to designate the Commissioner of Labor, with two other *ad hoc* commissioners, to act as a board of inquiry in such disputes. This investigatory provision was used only once—during the aftermath of the Pullman strike of 1894.[11]

Gompers and Wright

Although the AFL had not pressed for an independent labor department, it maintained a keen interest in the work of the agency. Gompers' thoughts on the development and expansion of information on the status of workers, labor-management relations, and the statistical supports for these developments, were expressed regularly during Wright's stewardship. He requested studies that would explore "the influence of the labor organizations upon the moral and national welfare of the wage earners in particular, and the whole community in general." Increased contact between the Department of Labor and State bureaus, according to Gompers, would achieve greater uniformity, simultaneous investigation, and assistance by the States.[12]

Asked to comment on the forthcoming 1890 census, Gompers called for inclusion of the number of unemployed, and the duration of their unemployment.[13] Gompers endorsed the establishment of a permanent Census Bureau in the Department of Labor, citing Wright's performance in Massachusetts.[14]

By 1893, there were a national Department of Labor and 32 State Departments of Labor and Bureaus of Labor Statistics, with factory inspectors in 19. Gompers could cite these as the results of successful labor efforts in obtaining measures which "a few years ago were regarded as chimerical and useless expenditures of public money [which] have come to be looked upon as a prime necessity to the proper conduct of governmental affairs." He also suggested that the men appointed as administrators should be sympathetic to the laws enacted and should not be subject to political change. Furthermore, he proposed that the U.S. Department of Labor follow the example of its British counterpart, by publishing a regular journal or bulletin which would provide information on existing industrial and other working conditions.[15] (In 1895, the Bureau began publishing a bimonthly *Bulletin*, a forerunner of the *Monthly Labor Review*.)

Congress was soon to authorize the establishment of the Bulletin of the Department of Labor in response to an AFL proposal, which drew conditional support from Wright. By endorsing the proposal he obtained congressional approval for departmental independence from Congress in the preparation and publication, and the opportunity to deal with current issues of vital importance, "rather than theoretical or debatable matters."[16]

Direct requests from labor organizations to the Department of Labor were infrequent. However, proposals which Wright circulated to the unions did cause Gompers to react. He advised the Department to conduct a study of the padrone system, publish abstracts of government contracts so that unions could check on enforcement of the 8-hour law, and he opposed a proposal for a census of unions.[17] These suggestions were met expeditiously.[18] Gompers duly noted Commissioner Wright's response at the annual AFL convention.[19]

While opposed to a census of unions, Gompers had only limited success in persuading the affiliated unions to provide information to the AFL which could be used to reflect the status of membership, finances, and support recognition for the AFL. This only made him more alert to Department of Labor reports on the subject, as he responded quickly to the release of the 10th Annual Report on strikes, "which sets forth clearly that in those States or localities, the industries in which the workers were organized, the largest numbers of successes were secured and concessions granted."[20] When Wright found that unions did not always cooperate in investigations and studies, Gompers urged cooperation. "Let there be light," he wrote, "confident that impartial investigations create numberless sympathizers in our great cause."[21]

Labor-management disputes

Wright and Gompers played prominent roles in two landmark labor-management disputes during this period. The investigative reports and recommendations on the Pullman dispute in 1894 and the anthracite coal strike in 1902 bore the imprint of Wright's evolving awareness of the importance of labor organization and its capacity to balance employer domination and achieve stability and continuity through agreement. Gompers could appreciate the fair treatment accorded the labor position in these reports, trailblazing in an era of employer opposition to incipient union organization. But he was against the recommendations for legislation for government involvement in strikes.

During the Pullman dispute, marked by Presidential use of Federal troops and injunction, the U.S. Strike Commission, with Wright as chairperson, was established by President Grover Cleveland. This was only after the failure of the strike by the American Railway Union led by Eugene Debs. The commission was established as an investigative body under the Act of 1888. Gompers, along with Debs and others, appeared before the commission. During the hearings, Wright asked Gompers whether sympathetic strike action such as that of the Pullman strike was justifiable when it could "paralyze, to any degree, the commercial industry of the country." Gompers replied, "I believe that labor has the right—the natural as well as the inherent right to endeavor to improve its condition . . . If industry or commerce is incidentally injured it is not their fault; the better course and the most reasonable course would be for employers to grant the reasonable requests that labor usually makes and thus avert the disaster of commerce or industry that you have mentioned." The social losses of widespread unemployment, both persistent and intermittent, were greater than disadvantages from strikes, he insisted, citing Wright's earlier reports. To Wright's queries regarding legislation for arbitration, Gompers expressed opposition, fearing it would lead to compulsory arbitration, with labor at a disadvantage.[22]

The recommendations of the Wright-chaired commission cited the quasi-public nature of railroad corporations as permitting the exercise of congressional authority over strikes in protecting the public. It urged employers to recognize unions, stressing that their interests were reciprocal, though not identical. A permanent commission was proposed to investigate and make recommendations in disputes having a major impact on the public, with enforcement by the courts. It was advised that yellow dog contracts be outlawed.[23]

Gompers eloquently praised the commission's report, although he implicitly disagreed about special legislation for mediation and arbitration in the railroad industry. He wrote, "Whatever may be the ultimate result of U.S. interference between the railroad managers and the railroad laborers of this country, we have confidence that none today will refuse to bestow a generous meed of praise on Carroll D. Wright and his companion commissioners for their lucid and conscientious report on the Chicago strike of 1894."[24]

The commission's recommendations became the basis for the consideration of legislation to deal with disputes having a major impact on the public. Ultimately, the result was to revise the 1888 statute by the Erdman Act of 1898, applicable to the railroads, providing for mediation, and for arbitration on request. The Commissioner of Labor and the Chairman of the Interstate Commerce Commission were designated as mediators. Yellow dog contracts were prohibited, but this provision was later voided by judicial decision.[25]

President Theodore Roosevelt's handling of the anthracite coal strike of 1902 contrasted with the Pullman situation. Wright and Gompers helped to ensure impartiality on the part of the Federal Government in the investigation of the ongoing strike, the dispute resolving machinery, and the resultant findings and recommendations.

At the President's request, Wright personally investigated the dispute. He also acted as intermediary between Roosevelt and Gompers as to means of settling the dispute. Wright prepared a well-received report. Subsequently, with the United Mine Workers willing to accept arbitration, Roosevelt prevailed on the mine operators to cooperate, and a commission was appointed. Wright was a member and recorder of the commission, and his earlier recommendations were apparent in the commission's award, which settled the strike. A side effect of the commission's role was abortive congressional consideration of a so-called national arbitration bill, which Gompers feared would lay the groundwork for compulsory arbitration. As he stated before the 1902 AFL Convention, Gompers believed that "the men of organized labor want arbitration, but only arbitration as a last resort after conciliation has absolutely failed, and then arbitration only, voluntarily entered into by both the organized workers and employers, the award voluntarily and faithfully adhered to by both sides."[26]

Department of Commerce and Labor

The labor effort to obtain a Cabinet-level Department of Labor was not a primary concern of the AFL for much of Wright's stewardship. This issue was only articulated as the pressure for a Department of Commerce and Industry representing business needs intensified in the late 1890's. Raising the Department of Labor to Cabinet-level status was proposed in a bill in 1894, and discussed in an article in the *American Federationist* entitled "Should the Commissioner of Labor be Made a Cabinet Officer?" The writer, who responded to Wright's opposition to the bill on the grounds that it would politicize the office, called attention to the growth in the importance of labor and labor-management developments as warranting such action.[27] In 1897, Gompers expressed his opposition to a proposal for a Department of Commerce and Industries to absorb the autonomous Department of Labor "introduced by a U.S. Senator, generally known for his hostility to labor's interests," and instead supported a bill for a Department of Labor with a seat in the Cabinet. The need was reasserted in 1901.[28]

President Roosevelt's enthusiasm for a Department of Commerce and Industries, with Republican control of the Congress, made the matter a foregone conclusion. But the Democratic minority fought hard. The proponents of the bill, including Senator Mark Hanna of Ohio, prominent in the National Civic Federation, which included Gompers along with leading industrialists, saw no conflict in the interests of capital and labor, and insisted that the interests of labor would be well represented in such a department. Wright was praised on all sides in the congressional debate, and it was urged that his role and that of his agency would only gain if transferred to the new department. The AFL and the unaffiliated railroad unions opposed the merger, supporting the establishment of a Cabinet Department of Labor. Only the near defunct Knights of Labor favored the merger.[29]

The controversy was resolved by altering the name to the Department of Commerce and Labor, which was established in 1903.[30] There was ambivalence in the AFL reaction to the new agency. Shortly thereafter, Gompers expressed some hope in that: "while there is cause for regret that the Department of Labor has been deprived of its independent existence, we yet have the assurance of the Honorable George B. Cortelyou, Secretary of the Department of Commerce and Labor, that it is his purpose to have the Department serve the best interests of labor."[31]

AFL interest in a separate Department of Labor waxed during the following decade, as its political interests and influence grew. But the AFL relations with Wright and his successor in 1905, Charles P. Neill, increased and were generally constructive. This was enhanced by President Roosevelt's concern with labor-management relations and the important role he assigned to Wright, and later, to Neill. Roosevelt wrote that the anthracite strike brought him "into contact with more than one man who was afterward a valued friend and fellow worker. On the suggestion of Carroll Wright, I appointed Charles P. Neill as assistant recorder to the Commission, whom I afterward made labor commissioner, to succeed Wright himself."[32]

As Gompers sized it up, Neill was recognized by labor officials "as the man in the administration closest to the President." Neill was regularly present when the President discussed major matters with union officials. Gompers' own respect for Neill was reflected in his assessment of the steel industry study, saying that "Dr. Neill performed a very comprehensive and valuable piece of work which caused the officials of the steel corporation to 'cuss him' and gnash their teeth."[33]

Compulsory investigation

The role of Government in the 1902 anthracite strike settlement was an augury of the Roosevelt policy of seeking to reduce the impact of strikes on the Nation, recognizing the right of unions to organize, and urging the need for public airing of labor dispute issues. Roosevelt's message to Congress in 1904 cited the positive role of Government in labor matters "merely by giving publicity to certain conditions," and praised the Bureau of Labor for doing excellent work of this kind. He asked that the Department of Commerce and Labor's Labor Bureau provide Congress with information on the labor laws of the various States, and be given "the means to investigate and report to the Congress upon the labor conditions in the manufacturing and mining regions throughout the country, both as to wages and hours of labor, as to the labor of women and children, and as to the effect on the various labor centers of immigration from abroad."[34] All of these subjects were concerns of the AFL, and their study was to be effectuated by the Bureau in the next few years.

Subsequently, Roosevelt proposed the compulsory investigation of disputes by the Federal Government, as a means of reducing the incidence of strikes.[35] In the hearings on proposed legislation, Commissioner Neill testified in support of this proposal, but only for controversies which became "sufficiently large and sufficiently troublesome to the public as to be a grave menace."[36] Although legislation was not enacted, the Bureau was called upon by the President and Congress to make investigations of several difficult situations. Although the AFL did not support labor dispute-handling legislation, the Bureau's investigative reports generally were cited with approbation.

After the anthracite coal report there was a series of landmark investigations of labor-management relations. They covered the background, origin, and points of view of labor organizations and management. President Roosevelt called for publication of the Bureau's report on the labor disturbance in a Colorado gold field, and coal mines in 1903–04, which contained an account of the violations of civil law and constitutional rights of the State's striking miners. While unaffiliated with the AFL, the Western Federation of Miners received the Federation's support. Wright, in his introduction to the lengthy report, referred to the public attention given to the deportation of striking miners by State militia, pointing to similar actions by citizens committees over a 25-year period.[37]

Under Neill's stewardship, the demands on the Bureau for investigative reports became more frequent. Neill's personal involvement in dispute situations was also compounded by the activation of the Erdman Act mediation provisions on the railroads from 1906 forward, and by his participation in mediation efforts in other situations as a member of the National Civic Federation. A threatened strike of telegraphers against the Postal Telegraph and Western Union Companies was referred to Neill by Roosevelt. Neill, Gompers, and Ralph Easley of the National Civic Federation failed in their effort to mediate the dispute. Subsequently, an intensive study of the telegraph companies, their methods of handling public business, and their labor relations and working conditions was prepared by the Bureau at the request of Congress. Among the findings regarding the situation after the unsuccessful 1907 strike, was that the Postal Telegraph Company formed "an organization of its own employees . . . restricted to employees of the Postal Company, and each employee desiring membership is required to agree not to retain membership or accept membership in any union while in the employ of the company."[38] A strike in the Nevada gold field district in 1907 resulted in Roosevelt's sending Federal troops in response to the Governor's appeal, but following this up promptly with an investigating commission which included Neill. Within 5 days, the commission reported that there was no insurrection when the troops were called, and that there was no statutory basis for such action; Roosevelt withdrew the troops.[39]

A series of strikes among immigrant workers in unorganized or partially organized situations involved Neill and the Bureau of Labor, with AFL activity and interest affected by the varying circumstances. A strike at the Pressed Steel Car Company of McKees Rock, Pa., where immigrant workers protested the failure to post rates of pay, was investigated by Neill, and cited by Gompers as evidence of the need for legislative provisions for better regulation of immigration.[40]

The steel industry became the focus of strike activity in 1909–10, and the AFL was forced to draw on both economic and political actions, as union organization faltered. In June 1909, U.S. Steel Corp. announced that it would henceforth operate completely on an open-shop basis, provoking a walkout by the Amalgamated Association of Iron, Steel and Tin Workers. During the unsuccessful strike which persisted for a year, the AFL provided support through organizers, and presented grievances against U.S. Steel at a meeting with President William H. Taft.

Conditions in the steel industry were again highlighted when a widely publicized strike of several thousand unorganized workers occurred at Bethlehem Steel in February 1910. The Senate passed a resolution, supported by the AFL, authorizing the Bureau of Labor to investigate the strike.[41] Authorized in March, with daily findings released almost immediately, and a final report published in May, the investigation had much impact. Conducted under the direction of Ethelbert Stewart, later Commissioner of Labor Statistics, the report pointed to the company's widespread practice of a 12-hour workday, 7-day workweek. U.S. Steel was noted as abolishing most Sunday work, as the Bethlehem study got underway.[42] When Charles Schwab of Bethlehem Steel protested that the report was unfair in failing to clarify that these conditions existed throughout the American steel industry, Commissioner Neill did issue such a statement.[43] Gompers commented that the reported conditions emphasized the physical hazards of overwork.[44]

A month after the publication of the Bethlehem report, the Senate authorized the Bureau to examine working conditions in the iron and steel industry. The resultant study, published within a year, was based on personal visits to plants with about 90 percent of the industry's employees. Wages, hours of work, and accidents were covered in the report. Its four volumes showed continued 6- and 7-day workweeks with 12-hour days, and questioned the need for Sunday work in view of U.S. Steel's workweek adjustment. The majority of the labor force was found to consist of recent immigrants who had come from rural backgrounds, were unskilled, and could neither speak nor understand the language of supervisors and skilled workers. Attention was called to the dilution of skills in the industry as mechanical developments spread, adding further to the large proportion of unskilled workers.[45] Gompers cited excerpts from the report to reply to "public opinion" that labor was well-treated in the industry.[46]

Gompers had occasion to analyze the findings of the Bureau of Labor concerning the Lawrence, Mass., strike of textile workers in 1912. He commented on the low wages of women employed in the mills, and the "outburst of unorganized workers" over the unannounced *pro rata* reduction of earnings because of the statutory reduction in hours of work for women and children, from 56 to 54 hours per week. The Bureau commented on the onset of the strike "started by a few unskilled, non-English speaking employees, which developed into an organized strike of more than 20,000 employees, with increases obtained."[47]

Field of work expands

The basic statistical work of the Bureau grew during its residence in the Department of Commerce and Labor. Despite the extensive demands on Commissioner Neill and the Bureau for special studies, new continuous statistical series were developed. The food price collection in 150 cities was continued from Wright's time. The annual collection of union wage scales in many cities was begun in 1907, and a regular strike statistics series was launched. Special studies and reports were directed at particular industrial situations.[48]

The involvement of Commissioner Neill and the Bureau of Labor in other matters of direct concern to the AFL was prominent and regular. During the Roosevelt and Taft administrations, labor's political influence grew, despite the opposition by much of industry to dealings with the unions. The Bureau was more actively sought as an avenue to enlightenment on a variety of issues and as an administrative agent to the enforcement of the Government's 8-hour law.

The presentation of Labor's Bill of Grievances to President Roosevelt in March 1906 produced prompt presidential concern for the negligence of the executive departments in enforcing the 8-hour law on Government contracts which had been on the statute books for a long time. Neill was immediately requested to investigate the charges. He found that there were violations of work laws, but enforcing them was difficult. Neill made recommendations which were followed by the President in an executive order. The next year, Gompers reported that there were fewer violations with the Bureau serving as a clearinghouse for complaints which were investigated and rectified.[49]

The immigration issue

The subject of immigration figured prominently among labor's grievances, and Neill was called upon by President Roosevelt to play a role. The Immigration Act of 1903, while making it unlawful to pay for the transportation or to encourage the importation of aliens or to advertise for them in foreign countries, did not apply to State agencies. Subsequently, South Carolina's establishment of a Department of Agriculture, Commerce, and Immigration to encourage immigration, with agents maintained abroad, was upheld by the attorney general.[50] Roosevelt called on Secretary of Commerce Oscar Straus to review the matter thoroughly, because "a great deal of feeling has arisen over the decision and many of the people most affected sincerely believe that it is the end of any effort to stop the importation of laborers under contract in the Southern States, and that this means further damage to laborers in the Northern States." Roosevelt also consulted with Neill because he had "exceptional advantages in the way of keeping in touch with the labor people and of knowing their feelings as well as their interests."[51]

The Immigration Act of 1907 subsequently closed the loophole. A provision in the new act setting up a Bureau of Information was originally viewed by the AFL as permitting "workmen lawfully coming to the United States . . . a more intelligent choice in which to seek employment and if administered fairly is calculated to be of least injury to labor."[52] Within a year, widespread domestic unemployment and the promotional activities of the Bureau of Information, headed by Terence Powderly, precipitated criticism of the Bureau. Secretary Straus called a conference of labor union officials attended by Gompers and Commissioner Neill. Straus and Powderly proposed extending the Bureau's activities to aid the domestic unemployed. The AFL position was that strengthening the Bureau would only make for more immigration, and that the Department of Commerce and Labor should devote its energies solely to meeting the problem of the domestic unemployed.

Neill also spoke out on aid to the domestic unemployed. He cited the deplorable wages and hours of work in the steel industry as largely caused by the constant stream of immigrants, who replaced other workers at lower wages. Further dissemination of information abroad would only increase the flow of immigrants, and there would be opposition to any information by the division to discourage immigration into any part of the country.[53]

Industrial education

Special reports were also prepared at the initiation of the AFL, with participation from other public interest groups. The Bureau had covered U.S. industrial education in 1892 and 1902 reports; but there was growing and intensified interest from the AFL, which corresponded with educators, academicians, and social work groups on the subject in 1908. In that year a committee was formed, which included Neill, union officials, and public interest representatives. Industrial education, along with the raising of the age limit of child employees and compulsory school attendance were basic principles of labor, and as Gompers expressed it, "working methods of manufacturing with their division and subdivision and specialization have, to a large extent, rendered nearly superfluous and therefore largely eliminated the all-around skilled worker. Some so-called modern apprenticeship systems are narrow, producing a line of trained specialists."[54] At the committee's request, the Bureau of Labor conducted a study of industrial education in 1910.[55] The AFL termed the resultant report the "most comprehensive inquiry ever made on the subject in the United States." The study provided support for legislative proposals by the AFL for Federal aid to the States for industrial education on the basis that, as Gompers expressed it, "the fact that industrial education, like academic education [has] become a public function and . . . that it should be paid for by public funds, is fast gaining supporters."[56] Success on the legislative front was finally achieved in 1917.

Women and children at work

A historic study of the conditions of working women and children, conducted by the Bureau over a 5-year period beginning in 1907, came after much encouragement by the AFL and welfare reform organizations to do so. The complementary interests of the Bureau and the AFL were reflected in a 1903 symposium in the *American Federationist* on employment of women and children. An article by Ethelbert Stewart called attention to results of the 1900 census, which showed the 10-year rates of growth of industrial employment were largest among children under age 16 and greater for women than for men more than 16 years old.[57] When Roosevelt asked for a sociological investigation with Commissioner Neill's support, Gompers and other union officials encouraged Congressional approval of the study, urging that it was necessary, and was not covered by the statistical records and work of the Census Bureau.[58] Assignment of the study to the Commissioner met with approval. The AFL and representatives of welfare organizations agreed at a conference to "cooperate with the Commissioner of Labor in the investigation, if necessary, to ascertain all the facts obtainable with a view to such cooperative action as shall at an early date free our country and our people from the stigma of exploiting young people for profit."[59] As the investigation proceeded, AFL representatives met with Neill to set up a division in the Bureau of Labor to deal with the conditions of working women and children.[60]

The 19 volumes of the study appeared over a 3-year period. Personal inspections and interviews, along with the analysis of published and establishment data, were used by Bureau staff and outside experts from universities, welfare organizations, and medical facilities in the conduct of the study. Among the subjects covered were the working and living conditions of workers in such industries as cotton textiles, men's clothing, glass, silk, retail trade, metal trades, and laundries; State legislation on child labor; causes of school leaving; the effect of employment on juvenile delinquency, on infant mortality and on criminality of women; family budgets of cotton mill workers; causes of death among female and child cotton mill operatives; and women in trade unions.[61]

Gompers claimed that the results of the study had "fully justified the action of the AFL in behalf of such an inquiry being made." Calling specific attention to the findings on accidents in metal trades, which showed hazards for women equal to those of men, hazards for children rare and decreasing, and that the most frequent accidents were largely preventable, Gompers went on to say: "what more can be said other than to extend a creditable recognition to the public officials who will make such a faithful, honest report."[62]

The scope and probing character of such a sensitive type of study made some adverse reaction inevitable. Compounded by public accusations by two disaffected Bureau employees, controversy arose in the Senate. Several southern members charged that the report overstepped the bounds of governmental investigations.[63] Although the study received resounding support from many sources, Neill was confronted with opposition which delayed his reappointment by President Taft. Appointed by Woodrow Wilson and confirmed shortly after the establishment of the new Department of Labor, in which the Bureau was to be lodged as the Bureau of Labor Statistics, Neill resigned soon afterward for financial reasons.[64]

THE RELATIONSHIP BETWEEN the AFL and the Bureau during the pre-Department of Labor period was one of mutual awareness and generally high regard. The AFL, and notably Gompers, followed the work of the Bureau, and used it in organizational, political, and educational activities. The Bureau's broad-gauge projects were self-determined, with substantial support from Presidents and Congress. These shed light on socioeconomic developments, national and international labor news, and industrial characteristics, reflecting the needs of the time for growing comprehension of the status of labor. While Gompers differed with Wright and Neill over the role of Government in handling strikes with a national impact, the commissioners' fair and balanced analyses of major disputes was accepted as a tempering influence on possibly more stringent approaches. With its growing political influence, the AFL pressed for and achieved a Cabinet-level Department of Labor. Although the Bureau then became one of several bureaus in the new Department of Labor, that did not obscure its unique role in furnishing a major foundation for the new agency. ☐

Nonwool yarn mills experience slow gains in productivity

During 1958–80, new equipment and techniques aided productivity growth; although the 2.3-percent rate of increase was less than for manufacturing as a whole, it accelerated during the last 8 years of the period

JAMES D. YORK

As measured by output per employee hour, productivity in the nonwool yarn mill industry increased at an average of 2.3 percent during 1958–80, somewhat below the 2.8-percent rate for all manufacturing.[1] (See table 1.) Output increased at an average annual rate of 4.5 percent while employee hours advanced at a rate of 2.1 percent. For the most recent period, 1973–80, productivity has risen at a faster annual rate—averaging 3.0 percent. Improved preparatory and spinning equipment have contributed to these gains.

Growth varied over the period of study. From 1958 to 1965, productivity increased every year, rising at an average annual rate of 5.2 percent. The largest jump occurred in 1961 with a rise of 9.3 percent. The 5.2-percent average gain in productivity reflected an average annual growth of 6.7 percent in output and 1.5 percent in employee hours. Since 1965, productivity gains have slowed considerably. During 1965–73, output per employee hour grew at an average annual rate of only 1.2 percent. Output increased at a 4.6-percent rate—just slightly faster than that of 3.4 percent for employee hours. Productivity movements displayed much year-to-year fluctuation during this time. There were increases in only 5 of 9 years, with the largest—7.1 percent—occurring in 1971.

In contrast to productivity movements for most industries, the growth in this industry accelerated during 1973–80, rising at an average annual rate of 3.0 percent. Output grew at a rate of 2.6 percent, while employee hours declined at a rate of 0.4 percent. Recessionary conditions in the economy in 1974 and 1975 had a strong impact on the trends in output and employee hours. In 1974, the yarn industry began sharp reductions in employee hours, as output fell 3.5 percent. The more than proportional drop in employee hours of 7.9 percent led to a 4.8-percent rise in productivity. In 1975, output posted a further decline of 4.2 percent. In the face of this continuing deterioration in output, employee hours experienced their largest single-year decline in the entire 1958–80 period, 15.7 percent. The resulting productivity increase, 13.6 percent, was the largest of the two-decade period.

Employment and plant size

Total employment in the spun yarn industry increased by more than 28 percent between 1958 and 1980, rising at an average annual rate of 2.1 percent. There were 67,800 employees in 1958, but by 1980 the total had risen to 86,900. However, the increase in employment was not steady; cyclical patterns were evident throughout the period, which were related to trends in the overall economy.

The establishments which produce yarn vary in size but, generally, are rather large. According to the 1977 Census of Manufactures, nearly 40 percent of all establishments employ 100 to 249 employees and these account for more than 30 percent of industry value of

---

James D. York is an economist in the Division of Labor Force Studies, Bureau of Labor Statistics.

Table 1. Productivity and related indexes for nonwool yarn mills, 1958–80

[1977=100]

Year	Output per employee hour	Output	Employee hours	Employees
1958	59.5	39.4	66.2	72.9
1959	62.3	44.8	71.9	72.9
1960	65.3	42.5	65.1	68.6
1961	71.4	45.1	63.2	65.6
1962	74.7	48.7	65.2	66.3
1963	76.3	50.3	65.9	66.3
1964	80.6	57.4	71.2	69.1
1965	84.6	66.5	78.8	73.8
1966	81.8	66.7	81.5	78.0
1967	77.5	61.7	79.6	80.1
1968	80.2	68.2	85.0	83.3
1969	84.5	74.4	88.0	89.3
1970	84.3	70.9	84.1	86.3
1971	90.3	82.0	90.8	89.2
1972	91.0	91.2	100.2	96.4
1973	85.0	88.9	104.6	102.7
1974	89.1	85.8	96.3	101.2
1975	101.2	82.2	81.2	87.7
1976	93.5	89.7	95.9	97.7
1977	100.0	100.0	100.0	100.0
1978	104.2	103.8	99.6	100.3
1979	103.9	99.0	95.3	95.8
1980	106.1	97.5	91.9	93.4
Average annual rates of change (in percent)				
1958–80	2.3	4.5	2.1	2.1
1975–80	1.7	3.4	1.7	0.7

shipments. Of the 456 establishments in the industry, almost 20 percent employ 250 to 499 employees and also account for more than 30 percent of total value of shipments. Only about 7 percent of all establishments employ 500 to 999 employees but these produce more than 20 percent of industry value of shipments.

Production workers have always represented a high proportion of total industry employment and that proportion has changed very little over time. In 1958, they accounted for slightly more than 94 percent of total employment and in 1980 their share was still about 92 percent. The proportion of female employees has increased in recent years, rising from approximately 44 percent of the work force in 1972 to 46 percent in 1980.

Average hourly earnings in the spun yarn industry have remained well below those of all manufacturing. In 1972, the first year for which such data are available, average hourly earnings were $2.53, significantly less than the $3.82 for all manufacturing. By 1980, average hourly earnings in the industry had risen about 89 percent to $4.78. However, this was still well below the average for all manufacturing, which was up to $7.27.

Diverse industry markets

Spun yarn is used for the manufacture of the great majority of textile products; household items which contain yarn include carpets and rugs, bedspreads, draperies, and towels. Its demand can be influenced by population changes, housing starts, changes in lifestyle or consumer tastes, and general economic conditions.

Nonwool yarn is purchased by many different manufacturers. Broad woven fabric mills are major users of spun yarn. These mills produce goods made from cotton, synthetic fibers, and silk, such as sheets, pillowcases, draperies, and towels. The firms which use synthetic fibers and silk are the largest purchasers of spun yarn. From 1963 to 1977, purchases by nonwool spinning mills increased nearly 90 percent, but those by broad woven cotton mills changed very little.[2]

Mills which produce knit fabric also account for a large proportion of total spun yarn purchases. These mills knit tubular or flat fabric and dye or finish knit fabric; their output increased rapidly from 1963 forward. This increase in output translated into rising yarn purchases by these mills. It is estimated that between 1963 and 1967, purchases of spun yarn by both circular and warp knit fabric mills increased by approximately 136 percent.

Other types of knitting mills also use spun yarn, including knit outerwear and underwear mills and hosiery mills. The first type manufactures products such as suits, slacks, shirts, neckties, and skirts. Although complete information is not available for all years, estimates indicate that purchases of spun yarn by knit outerwear mills decreased during the 1963–77 period.

Exports have historically accounted for a negligible portion of the total market. In 1979 and 1980, although exports increased rapidly, they only accounted for approximately 2 percent of yarn shipments. Imports have had little impact on the domestic market, making up less than 1 percent of apparent consumption in recent years.[3]

Advances in technology

The production of spun yarn involves a number of different operations. Improvements in technology have taken place at different stages of the production process and have contributed to the industry's overall growth. Much of the advance has resulted from gradual improvements in the equipment over time.

The raw material arrives at the mill as bales. The adoption of automatic bale opening and blending equipment, which eliminates the need for manual performance of this operation, has led to greater efficiency in this initial stage of the production process.

Likewise, improvements have occurred in the carding operation. In it, the fibers of the raw material are made parallel to each other and most of the foreign matter is removed. The fibers emerge in a form known as sliver. Formerly, the yarn entered a picker which formed it into a roll before being fed into the carding machine. However, the introduction of the automatic chute feed which permits the blended fibers to be fed directly into the carding machine, has eliminated the need for a picker. The carding machinery itself has increased in speed, further contributing to productivity gains.

The drawing and roving operations follow the carding process. The drawing operation makes the slivers more uniform. In the roving process, a twist is imparted to the sliver by the roving frame. This results in greater strength. The product that emerges is known as roving and is wound onto bobbins which are taken up when full. The adoption of larger bobbins has reduced the amount of tending necessary because they do not have to be removed as often. Improved roving equipment has been introduced which is faster and eliminates the need to remove the flyers (which insert twist into the fibers) for doffing (removal of the bobbins).

After the roving operation, the roving bobbin proceeds to the spinning operation. The spinning drafts (draws out) the fibers to size the yarn and puts the desired twist into it, providing necessary strength. Yarn is spun onto bobbins; the use of larger ones on spinning machines has reduced the frequency with which bobbins have to be removed. The introduction of automatic doffing equipment—equipment which removes the full bobbins and replaces them with empty ones—has also improved productivity. Increased operating speed of the spinning equipment itself has also contributed to productivity gains.

After spinning, the yarn is taken to the winding department. Here, winding machines remove the yarn from the spinning bobbins and wind it onto cones for direct customer shipment or onto tubes for dyeing. Automation in winding equipment has taken place and has increased productivity growth immensely.[4]

A number of plants have introduced open-end spinning, which has also aided productivity. This combines into one process the three separate operations of roving, spinning, and winding, thus eliminating the need for a separate roving and winding operation. Open-end spinning can wind the yarn onto a package rather than a spinning bobbin; thus, a separate winding operation to transfer the yarn from the spinning bobbin to a cone is no longer needed.[5]

Capital spending

Rises in labor productivity are frequently linked to increases in capital formation. Data available through 1979 indicate that, over 1958–79 as a whole, current-dollar new capital expenditures rose at an average annual rate of 9.4 percent. However, the advances were not uniform throughout the period, and the most rapid ones took place in the earlier years. From 1958 to 1966, new capital expenditures increased at a 22.1-percent rate. This acceleration in capital spending coincided with rapid productivity growth. During 1958–66, the rate of increase in output per employee hour was 4.6 percent. Both productivity and capital expenditures posted increases in all but one year of the 1958–66 subperiod.

The tremendous growth in capital expenditures during this time caused the ratio of capital expenditures per employee to go up far more rapidly than for all manufacturing. In 1958, capital spending per employee was only $229 in the spun yarn industry, compared with $619 for all manufacturing. However, by 1966, capital spending per employee in the industry had risen to $1,368, compared with $1,112 for all manufacturing.

From 1966–79, the trends in both capital expenditures and productivity were quite different from the preceding years. The rate of increase in capital expenditures declined to 4.9 percent. There were even substantial decreases in a number of years. Productivity growth likewise experienced a slowdown, dropping to an average annual rate of increase of 2.2 percent. As in the case of capital expenditures, there were declines in some years. The decline in the growth rate of capital expenditures caused the rate of increase in the ratio of capital expenditures per employee to fall behind that of all manufacturing. From 1966–79, capital spending per employee in the spun yarn industry advanced at an average annual rate of only 3.0 percent, compared with a rate of 9.2 percent for all manufacturing. Consequently, capital spending per employee was only $1,607 in 1979, compared with $3,118 for all manufacturing.

PRODUCTIVITY SHOULD CONTINUE to increase as improvements in production equipment take place and as more manufacturers take advantage of these. Some of the newer equipment, which embodies more advanced technologies than past models, is capable of producing better quality yarn with fewer imperfections and weak spots. This top quality is increasingly demanded by customers as they adopt higher speed weaving and knitting machinery.[6] This is accelerating the adoption of more modern production equipment by nonwool yarn mills.

Some industry officials expect labor market conditions to provide added stimulus for use of improved production equipment.[7] Relocation of the manufacturing operations of many industries into major textile producing areas exerts additional pressure on existing labor and wages. This, in turn, is impelling more yarn manufacturers to utilize the equipment and techniques which provide the greatest levels of output per employee hour.

Open-end spinning will continue to contribute to productivity gains as it becomes more widely adopted. This form of spinning has a particularly favorable effect on production efficiency because, as noted earlier, it combines the separate operations of roving, spinning, and winding into a single process. □

FOOTNOTES

[1] The nonwool yarn mill industry consists of establishments primarily engaged in spinning yarn wholly or chiefly by weight of cotton, synthetic fibers, or silk. It is designated as industry 2281 in the 1972 Standard Industrial Classification (SIC) Manual. All average annual rates of change are based on the linear least squares trend of the logarithms of the index numbers. Extension of the indexes will appear in the annual BLS Bulletin, *Productivity Measures for Selected Industries.*

[2] The discussion of yarn purchases from nonwool yarn mills by the consuming industries is based on constant-dollar estimates.

APPENDIX: Measurement techniques and limitations

Indexes of output per employee hour measure changes in the relation between the output of an industry and employee hours expended on that output. An index of output per employee hour is derived by dividing an index of output by an index of industry employee hours.

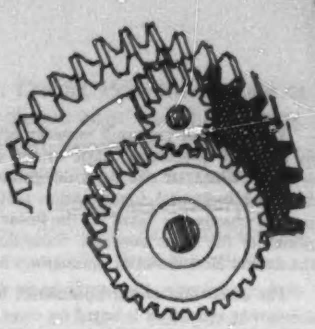
The preferred output index for manufacturing industries would be obtained from data on quantities of the various goods produced by the industry, each weighted (multiplied) by the employee hours required to produce one unit of each good in some specified base period. Thus, those goods which require more labor time to produce are given more importance in the index.

In the absence of adequate physical quantity data, the output index for this industry was constructed by a deflated value technique. The value of shipments of the various product classes were adjusted for price changes by appropriate Producer Price Indexes to derive real output measures. These, in turn, were combined with employee hour weights to derive the overall output measure. The result is a final output index that is conceptually close to the preferred output measure.

Employment and employee hour indexes were derived from data published by the Bureau of the Census because BLS data were not available. Employees and employee hours are each considered homogeneous and additive, and thus do not reflect changes in the qualitative aspects of labor, such as skill and experience.

The indexes of output per employee hour do not measure any specific contributions, such as that of labor or capital. Rather, they reflect the joint effect of factors such as changes in technology, capital investment, capacity utilization, plant design and layout, skill and effort of the work force, managerial ability, and labor-management relations.

Productivity Reports



Labor and material requirements for hospital construction

DAWN E. DOUGHERTY

In 1980, each $1,000 of contract cost for hospital construction generated an estimated 51.4 hours of work, according to a Bureau of Labor Statistics survey.[1] This means that each $1 billion spent on hospital construction in 1980 would have created 27,129 jobs—12,850 in the construction industry and 14,279 in industries which produce and deliver the materials, equipment, and supplies used in construction. The 1975 survey indicated that each $1 billion of hospital construction would have provided 21,528 jobs in construction and 24,256 in related industries.[2]

The survey covered hospital and nursing home construction. However, this summary presents data for hospitals only; a detailed report covering both hospital and nursing home construction is being prepared. This was the third survey for hospitals and the second for nursing homes. It measured employee hours per $1,000 of contract cost and per 100 square feet of construction. A sample of 34 hospitals and 8 nursing homes completed in 1976 was drawn to represent a universe of 90 hospitals and 16 nursing homes. All projects were funded under the former Department of Health, Education, and Welfare's Hill-Burton program. Data for onsite employee hours, material and labor costs, and project characteristics were obtained through visits to general and special trade contractors.

Employee hours

For each $1,000 of contract cost for hospitals completed in 1976, 87.7 employee hours were required. The following tabulation shows the distribution of employee hours per thousand current dollars for hospitals constructed in 1975, and estimates for 1980.

	1975	*1980*
Construction	39.2	23.4
Onsite	34.7	20.7
Offsite	4.5	2.7
Manufacturing	29.3	16.5
Trade, transportation, and services	15.1	9.1
Mining and all other industries	4.1	2.4

Nearly 89 percent of the hours required in the construction industry in 1975 were spent onsite. The remaining hours represent builders' offsite administrative, office, and warehousing duties.[3] The employee-hour requirements in other industries, which were greater than construction employee hours, composed 55 percent of all hours.[4] Manufacturing accounted for the largest number of these indirect hours with 60 percent.

Onsite hours. Onsite employee-hour requirements per $1,000 of contract cost decreased between each of the three studies. Hospitals surveyed in 1960 and 1966 required 88.8 and 76.1 onsite hours, respectively, compared with 34.7 in 1975.[5] In constant (1972) dollars, 46.7 employee hours were required in 1975, compared with 52.7 in 1960 and 49.9 in 1966. This means that onsite hours declined at an average annual rate of 0.8 percent between 1960 and 1975 and 0.7 percent between 1966 and 1975. Factors contributing to the decline include improvements in construction methods, changes in the types of materials used, differences in individual project characteristics, and increases in productivity. Although onsite hours cannot be used as an exact measure of productivity, changes in onsite hours give an indication of productivity trends in the construction industry.

By occupation. Skilled workers contributed 68.6 percent of all onsite hours in 1975 (table 1). In 1960, skilled workers accounted for 67.8 percent of all hours and in 1966, 70.3 percent. Plumbers (including pipefitters and steamfitters), carpenters, and electricians accounted for the largest proportion of skilled employee hours in all three studies. The proportion of hours contributed by electricians increased with each study, reflecting a growing sophistication and complexity in the electrical equipment and lighting systems used by hospitals.

Dawn E. Dougherty is an economist in the Office of Productivity and Technology, Bureau of Labor Statistics.

Semiskilled and unskilled workers accounted for 22.4 percent of all onsite hours in 1975; in 1960 and 1966, they represented 28.4 percent and 26.4 percent, respectively. The proportion of hours contributed by professional, clerical, and supervisory workers, which was 3.9 percent in 1960 and 3.2 percent in 1966, increased to 8.6 percent in 1975. Supervisory workers' hours accounted for most of this increase.

By type of contractor. General contractors accounted for the greatest proportion in onsite hours with 26.6 percent. In comparison, general contractors contributed 39.1 percent in 1960 and 36.5 percent in 1966. This decline indicates that general contractors are subcontracting more of their onsite duties to special trade contractors. Plumbing and heating, ventilating, and air-conditioning contractors had the second highest proportion of onsite hours, reflecting the extensive amount of plumbing done in hospital construction. Electrical contractors made up the third largest group. This was true for both of the earlier studies, although the proportion contributed by electrical contractors increased between the studies.

Project characteristics

Hospitals completed in 1976 were larger and cost more to build than those previously studied (table 2).

Table 1. Onsite labor requirements per $1,000 of contract cost, by occupation and type of contractor, 1975

Occupation	Percent	Type of contractor	Percent
All occupations	100.0	Total	100.0
Skilled workers	68.6	General contractors	26.6
Brickmasons	3.5		
Carpenters	12.5	Special trade contractors	73.4
Concrete finishers	2.5	Plumbing, heating and air-conditioning	23.8
Drywall installers	1.0		
Electricians	11.9	Electrical	13.0
Elevator installers	0.7	Plastering and lathing	6.5
Glaziers	0.5	Masonry	5.5
Insulation workers	2.2	Concrete work	4.4
Lathers	2.1	Roofing and sheet metal work	2.4
Operating engineers	2.1		
Painters	1.6	Ornamental and structural metal work	2.2
Pipefitters and steamfitters	6.0	Wallboard	2.1
Plasterers	1.5	Painting and wallpapering	1.9
Plumbers	6.6	Terrazzo and tile work	1.7
Reinforcing ironworkers	1.6	Carpentry	1.6
Roofers	0.6		
Sheet metal workers	5.4	Excavations, foundations, footings, and grading	1.4
Structural metal and ornamental ironworkers	2.6	Elevators	1.2
Tile setters, hard	0.6	Insulating	1.1
Other skilled workers	3.1	All other types	4.6
Semiskilled and unskilled workers	22.4		
Laborers	19.0		
Helpers	1.6		
Truck drivers and other semiskilled or unskilled workers	1.8		
Supervisory, professional, technical, and clerical workers	8.6		

NOTE: Detail may not add to totals due to rounding.

Table 2. Selected project characteristics for hospital construction, 1960, 1966, and 1975

Characteristic	1960	1966	1975
Number of projects	46	61	90
Floor space (1,000 square feet)	56.5	63.5	163.6
Average total cost	$1,463,723	$1,811,459	$8,097,826
Cost per square foot	$25.93	$28.51	$49.46
Number of beds per project	86	82	128
Cost per bed	$16,947	$22,172	$63,448
Proportion of average total cost for—			
Onsite wages and salaries	28.2	29.6	27.7
Materials, built-in equipment, and supplies	53.2	50.4	42.2
Construction equipment	1.2	1.3	2.4
Residual	17.4	18.7	27.7

Additions to existing hospitals continued to outnumber new hospital buildings. The proportion of additions increased from 57.4 percent of all projects in 1966 to 81.9 percent in 1975, which may help to explain the large increase in project cost between the two studies. Cost per square foot is generally higher for additions than for new hospitals, because extensive alterations to the original building are often required before new construction can begin.

Between the earliest and latest studies, the average number of square feet per project increased twice as much as the number of beds. This suggests that the newer hospitals contain more space for equipment and special purpose areas (such as diagnostic and therapy rooms, laboratories, and x-ray rooms) than the hospitals in the earlier studies.

Costs

Components of cost. The proportion of total hospital contract cost for onsite wages and salaries declined between 1966 and 1975, after increasing between the first and second studies (table 2). Materials, built-in equipment, and supplies showed a large decrease, from 53.2 percent of total contract cost in 1960 to 42.2 percent in 1975. The proportion of total cost for contractor's equipment increased slightly between the first and most recent studies. Profit and overhead (which includes interest expenses, salaries of offsite workers, supplementary wage benefits, office and other overhead expenses, and profit) jumped from 17.4 percent in 1960 to 27.7 percent in 1975. Higher interest rates and increases in salaries and supplementary benefits were the major factors contributing to this rise.

Materials costs. Materials, built-in equipment, and supplies accounted for the largest proportion of contract cost. Of the types of materials used, fabricated metal products had the highest cost per $1,000 of construction value (table 3). Stone, clay, glass, and concrete products were next, followed by electrical machinery and equipment. These three product groups accounted for more than half of all the materials used in hospital construction in 1975. The proportion of total material cost for electrical products increased between 1966 and 1975, replacing built-in equipment and nonelectrical machinery as the third most important product group.

Regional data

Project characteristics. Data compiled by region[6] reflect differences in project design, size, and cost (table 4). On average, the largest projects were in the South. Hospitals built in the South had the highest average cost, the most floor space, and took longer to build than those in all other regions. Hospitals in the Northeast were the smallest and the most expensive (per square foot). The majority of projects in the Northeast were small additions to existing hospitals; they contained relatively little floor space, and several included extensive rehabilitation work. Fewer hospitals were built in the West than in any of the other regions; thus, the difference between the proportion of additions and new buildings for that region and the United States as a whole.

Hours and wages. The South had both the lowest average hourly wage and the smallest ratio of wages to total contract cost. Onsite employee-hour requirements per $1,000 were highest in the South, which suggests that the relatively low wage rates in the region encouraged the use of labor intensive construction methods. Thus, the low wage rate is thought to be responsible for the South having the smallest ratio of wages to total contract cost, even though employee-hour requirements were highest. The North Central region had the highest average hourly wage, and was tied with the West for the largest ratio of wages to total cost. Employee-hour requirements were lowest in the Northeast, where the majority of projects were located in metropolitan areas. Because hourly wages and the availability of skilled workers are usually greater in metropolitan areas, employee-hour requirements tend to be lower for projects built in metropolitan rather than nonmetropolitan areas. □

Table 3. Cost of materials, equipment, and supplies used in hospital construction, 1975

Type of material	Cost per $1,000 of contract cost	Percent
All materials, equipment, and supplies	$442.24	100.0
Materials, built-in equipment, supplies	417.84	95.5
Agricultural products	.40	.1
Mining of nonmetallic minerals, except fuels	1.44	.3
Textile mill products	1.06	.2
Lumber and wood products, except furniture	13.18	3.0
Furniture and fixtures	10.06	2.3
Paper and allied products	1.73	0.4
Chemicals and allied products	4.48	1.0
Petroleum refining and related products	4.96	1.1
Rubber and miscellaneous plastic products	4.65	1.0
Stone, clay, glass, and concrete products	81.90	18.5
Primary metal products	43.73	9.9
Fabricated metal products	105.26	23.8
Machinery, except electrical	58.77	13.3
Electrical machinery, equipment, and supplies	66.74	15.1
Measuring, analyzing, and controlling instruments	15.11	3.4
Other materials and supplies	4.36	1.0
Construction equipment	24.40	5.5

NOTE: Detail may not add to totals due to rounding.

Table 4. Selected project characteristics for hospital construction, by region, 1975

Project characteristic	United States	Northeast	North Central	South	West
Average number of square feet per project (100 sq. ft.)	1,636.4	859.5	1,798.9	2,001.1	990.0
Average cost per project	$8,097,826	$6,400,883	$7,963,530	$10,009,634	$5,435,938
Average cost per square foot	$49.48	$74.48	$44.27	$47.87	$54.91
Average number of weeks of construction	154	145	149	174	121
Additions as a percent of all projects	81.9	87.7	85.7	84.3	49.5
New buildings as a percent of all projects	13.2	12.3	14.6	15.7	49.5
Percent of projects in metropolitan areas	49.9	62.6	44.5	48.9	49.5
Percent of projects in nonmetropolitan areas	50.1	37.4	55.5	51.1	49.5
Employee hours per $1,000 of contract cost	34.7	32.0	33.8	36.3	35.4
Average hourly wage	$7.99	$8.60	$8.70	$7.18	$8.29
Wages as a percent of total contract cost	27.7	27.5	29.4	26.1	29.4

FOOTNOTES

[1] Employee-hour estimates for 1980 were based on 1975 onsite employee-hour data, adjusted for price and productivity change. The deflator used to adjust the onsite hours for price change was the Bureau of the Census' cost index for nonresidential buildings: 1965–66—65.6; 1974–75—134.65; 1980—217. Productivity change was calculated by adjusting the change in onsite hours for prices between the 1966 study and the latest study. The average annual rate of change was 0.7 percent. Although most of the projects in the latest survey were completed in 1976, most of the construction value was put in place during 1974–75.

[2] Employment estimates were derived using 1,800 hours per year for onsite construction; 2,000 for offsite construction; 2,068 for manufacturing; 1,779 for trade, transportation, and services; and 2,025 for mining and all others.

[3] Offsite employee hours were estimated using the ratio of nonconstruction employees to total employees for special trade contractors in the contract construction industry, as reported in *Employment and Earnings*, Bulletin 1312-11 (Bureau of Labor Statistics, 1979). This ratio was applied to the onsite hours obtained in the survey, which had been adjusted for the hours worked by administrative and clerical employees.

[4] Indirect employee hours were calculated using inter-industry growth models. Data on materials and equipment were grouped by type, and the dollar amounts for each group were adjusted by the appropriate producer price index. The data were then processed through the Bureau of Labor Statistics' input-output model to determine the number of employee hours required per $1,000 of construction for each industry group.

[5] The first two surveys are referred to as the 1960 and 1966 studies; however, most of the construction occurred during 1959–60 and 1965–66, respectively. See *Labor Requirements for Hospital Construction*, Bulletin 1340 (Bureau of Labor Statistics, 1962); Herman J. Rothberg, "Labor requirements for hospital construction, 1959–60," *Monthly Labor Review*, October 1962, pp. 1120–24; *Labor and Material Requirements for Hospital and Nursing Home Construction*, Bulletin 1691

(Bureau of Labor Statistics, 1971); and Martha Farnsworth Riche, "Man-hour requirements decline in hospital construction," *Monthly Labor Review*, November 1970, p. 48.

[8] Data were provided for the continental United States and four broad geographic regions. The States included in each region were: *Northeast*—Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont; *North Central*—Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin; *South*—Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia; and *West*—Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Impact of new electronic technology

RICHARD W. RICHE

The steady stream of technological progress that has characterized our society in America has resulted in higher productivity, elimination of many menial and dangerous jobs, higher wages and shorter hours, and a continuous flow of new products and services which have resulted in a higher standard of living. New industries employing thousands of workers have been formed to manufacture computers, electronic products, and technologies to provide energy and control the environment.

To be sure, innovation in industries such as longshoring, agriculture, and printing, to name a few, has eliminated jobs and required workers to acquire the unfamiliar skills associated with new technology. For some, the adjustment has been painful. But on balance, there is general agreement that the benefits of new technology far outweigh the disadvantages, and that innovation has led to economic progress, new job opportunities, and a more prosperous society.

At this point, early in the decade of the 1980's, there is widespread agreement that the pace of diffusion of technologies which incorporate advanced electronics will be accelerated over the next few years. The experience in the United States suggests that as long as the economy is growing, the introduction of innovations with potential for productivity gains can be compatible with rising employment. When computers were first introduced for office data applications, for example, frequently predictions were made that large numbers of clerical and kindred workers would be displaced and that job opportunities for millions would be curtailed. What actually did happen was quite different. In 1960, clerical workers in the United States numbered about 10 million and accounted for about 15 percent of total employment. By 1980, there were more than 18 million clerical workers and they accounted for about 19 percent of the total. Thus, instead of decreasing as had been predicted, clerical employment increased about 85 percent. And, it is projected to grow significantly to 1990.

Why did clerical employment increase instead of decreasing as predicted? First, normal growth in the volume of clerical work exceeded jobs eliminated by the computer. Second, computers made possible work that was previously impractical because it would have been too costly and too time consuming. Using computers, managers can now prepare reports and analyses that previously were desirable but too costly.

In addition to creating employment by expanding the scope of activities for many industries, the computer required new occupations such as systems analysts, programmers, keypunch operators, console operators, and tape librarians. And new industries were established to manufacture computers and related equipment, creating a variety of occupations and employing thousands.

Technological change can cause job displacement, especially when the industry is concentrated in a particular region or locality. Sometimes the employment impact is direct, as in the case of agriculture. In most cases, however, the effect is less obvious. Output does not advance at the same rate as productivity in all industries or plants, and consequently some industries register employment declines while others register increases. Regardless of the reason, displacements are costly for both the individual and the Nation.

This report examines four major technological changes under way in the United States and discusses prospects for their further diffusion. The four areas are microelectronics, industrial robots, telecommunications, and office automation.

The development of *microprocessors and microcomputers* in the early 1970's, and their widespread diffusion as we enter the 1980's, is a major innovation in electronics. Over the past three decades, the transistor that replaced the bulky vacuum tube was a first step in the development of miniaturized semiconductor integrated circuits which provide more power and reliability in a significantly smaller package. A microprocessor unit contains thousands of electronic components and complex circuits on a silicon chip less than one centimeter square. The unit can be combined with memory and input-output capability to build a microcomputer.

The use of microelectronics has had a significant im-

Richard W. Riche is an economist in the Office of Productivity and Technology, Bureau of Labor Statistics. This report was adapted from his presentation at the Organization for Economic Cooperation and Development's Second Special Session on Information Technologies, Productivity, and Employment, held in Paris, France, Oct. 19–21, 1981.

pact on American consumers, workers, and manufacturing operations. A vast array of products—calculators, digital watches, video games, TV sets, and microwave ovens, to name a few—incorporate microprocessors and microcomputers. But behind the scenes in American manufacturing plants, production technologies and manufacturing methods are undergoing equally dramatic changes. Microelectronics are being incorporated in systems which control key production equipment, such as industrial robots and numerically-controlled machine tools. Moreover, microelectronic devices increase the processing capability of word processors, computers, data transmission and copying devices, automatic checkout counters, and other such equipment used by banks, insurance companies, and retail and wholesale establishments.

The *industrial robot* is a second major technological innovation capturing current attention. The Robot Institute of America defines a robot as "a reprogrammable multifunctional manipulator designed to move material, parts, tools, or specialized devices through variable programmed motions for the performance of a variety of tasks." According to the institute, about 4,000 robots are in use in U.S. establishments, with a large share in automobile manufacturing plants. They perform tasks such as material transfer, die casting, spot welding, spray painting, and limited assembly. Although U.S. industry is increasing its use of robots, Japan leads the world in robot use with more than triple the number of installations in the United States.

There is little information on the impact of robots on productivity and employment. However, evidence suggests that, following installation of robots, productivity is increased, unit labor requirements frequently are lowered, and quality control is improved. At one large manufacturer of refrigerators, for example, a robot sprays paint on refrigerator liners twice as fast as the two-person crew that it replaced.[1] The future impact of robots on productivity and employment will depend on the extent of development and diffusion of new generations of robots that can "see and feel."

Technological changes in *telecommunications* are underway in all major segments of the industry. These innovations are boosting productivity and changing the type of labor required in the two basic processes of telephone communication—call switching and signal transmission. The electronic computer is used extensively in both processes, as well as in other operational tasks and in management and accounting functions.

In call switching, electronic switching systems use high speed computers to handle local and long-distance calls. A growing share of calls is handled by electronic switching systems; total conversion is anticipated by the year 2000. These systems can handle three to four times more calls than electromechanical systems.

Sharp gains in long-distance volume have led to two innovative and important technologies in signal transmission—the millimeter waveguide and fiber optic cables. Both have far greater call-handling capabilities than the existing coaxial cables and microwave relays. The millimeter waveguide is essentially an underground tube through which signal-carrying waves are transmitted. It is designed for use on high density communication routes. Currently, this technology is being tested; future diffusion will depend on call volume growth.

Fiber optic cables for signal transmission are expected to become a major transmission medium in the 1980's. In this technology, glass fiber cables are combined with semiconductor light sources for very high capacity transmission. The fiber cables are compact, resist electrical interference, and interface well with digital switching and transmission techniques.

Other major changes anticipated for the telecommunications industry include further expansion of satellite communication, digital transmission, computerized systems for maintenance and testing, and automation of switching and billing tasks. Experts also foresee nontraditional uses of the communications network for electronic funds transfer in banking, electronic postal service functions, and data systems for the home which will combine communications and data processing capabilities.

Office *data handling and communication* is a fourth area where major technological change has occurred. A large segment of the Nation's work force, including more than 18 million clerical workers, is engaged in producing and processing data. Historically, capital investment in the office has lagged that of other operations, with investment per office worker amounting to less than $2,000, compared with about $25,000 per factory worker.[2]

This "investment gap" may be closed in the years ahead. Investment in office technologies will likely accelerate during the 1980's, as managers turn to modern data handling technologies to reduce labor, material, and related expenses. The largest share of office costs are deemed to be labor-related—a strong incentive for further mechanization.

Specific technologies to be diffused more widely include more powerful electronic computers; advanced model word processors; new equipment and techniques to store, retrieve, and transmit data on microfilm; and electronic mail networks. Increasingly, paper will be replaced by electronic images on a screen which can be transmitted by telecommunication methods.

General impact of innovations

Following are conclusions from the Bureau of Labor Statistics' research on the implications of technological change for the work force.

- While all industries are experiencing technological change, the pace varies among and within industries. Each industry has its own story and it is not always in terms of computer technology and advanced automation. But even conventional changes, such as materials handling mechanization or the installation of larger capacity equipment or machines with faster speeds, are often major developments requiring workers to obtain new skills.
- The size of investment required, the rate of capacity utilization, and institutional arrangements are some of the factors that act as an "economic governor" on the speed of diffusion of technological change and, in turn, possible employment implications.
- Industries with greater application of technological advances generally experience larger increases in productivity (examples, air transportation and telephone communication); industries lagging in application of technological advances generally experience smaller or negative changes in productivity (examples, footwear and wood household furniture).
- The content of jobs and the qualities required of workers are being modified by technological changes. There is less demand for manual dexterity, physical strength for material handling, and for traditional craftsmanship. In contrast, employers are placing more emphasis on formal knowledge, precision, and perceptual aptitudes. As many manual tasks are mechanized, unskilled workers become monitors of very expensive equipment. The reduction in repetitive tasks that are so dissatisfying to the industrial worker may be welcomed, but the isolation and constant monitoring associated with advanced technology can create new stresses.
- Higher educational achievement of workers is becoming essential. The ability to read and write at a functional level is mandatory to interpret operating instructions of complex equipment, and to be retrained for the new skills demanded by changing technology.
- Many new occupations created by new technologies can be filled by retraining employees. Most retraining is accomplished in-plant and includes on-the-job and classroom instruction.
- In general, relatively few employees have been laid off because of technological change. This is due, in part, to the use of various techniques by the private sector to minimize adverse effects to the worker—techniques such as providing advance notice, retraining, and reassigning displaced employees to new jobs. ☐

Research Summaries

Forgotten unemployment: recall bias in retrospective data

FRANCIS W. HORVATH

It is a well documented fact that the ordering and specific wording of a survey questionnaire can produce different "readings" of the same underlying event. Differences can also arise when the same general question is asked of individuals at different times.

One area in which such discrepancies have been found is in comparisons of unemployment data collected on a monthly basis with those obtained from a once-yearly survey. The source of the monthly unemployment figures is the Current Population Survey (CPS), conducted by the Census Bureau for the Bureau of Labor Statistics. Each month, representatives of approximately 60,000 households are asked questions about their labor force activity and that of other household members during a given reference week. Annual unemployment estimates are constructed by averaging monthly data for the year.

Annual unemployment data are also obtained, on a retrospective basis, from the Work Experience Supplement to the Current Population Survey in March of each year. Persons responding to the supplement questions are asked to recall events which occurred from January through December of the previous year. These respondents are asked to aggregate the year's labor force activities into summary figures. That is, they are asked questions such as: "How many weeks was (household member's name) looking for work?" and "How many weeks was (household member's name) working?" However, no attempt is made to ascertain the months in which these events took place.

The supplement data reflect the number of persons with unemployment at any time during the previous year; a person experiencing two or more spells of unemployment is counted only once. Recently, this estimate has been about 18 to 21 million persons a year. In contrast, the annual average of the unemployment data collected monthly—simply the sum of the 12 monthly estimates (unadjusted for seasonality), divided by 12—represents the mean number of persons unemployed during a "typical" week of the year. This figure was about 5 to 7 million during 1975–79. On the surface, these two figures appear unconnected. However, because the Work Experience Supplement also includes questions on the duration of unemployment in the previous year, it is possible to directly relate the retrospective supplement information to the annual averages of the monthly data.

The basic method, developed by Daniel Suits and Richard Morgenstern,[1] derives the total number of weeks of unemployment occurring in the labor force during the full year from the Work Experience Supplement. Specifically, persons are grouped according to the supplement information into "duration of unemployment" intervals. Multiplying the number of persons in each group by the midpoint (in weeks) of the duration interval yields an estimate of the total weeks of unemployment occurring to persons within that particular cell. The sum over all cells provides an estimate of the total weeks of unemployment occurring in the labor force over the year. Dividing this total by 52 gives the adjusted supplement estimate of a typical week's unemployment, roughly comparable to the results from the monthly studies.

Exhibit 1 shows this basic relationship, using hypothetical data. Over a given year, there are 155 individuals reporting some unemployment. Suppose that most of these are unemployed in 1 month only, and during all other months they are either employed or not in the labor force. However, assume that 25 of the 155 report unemployment in 2 consecutive months. In the monthly survey, then, the total reported instances of unemployment would be 180; annual average unemployment would be 180 divided by 12, or 15 individuals. With an accurate annual retrospective survey, the number of persons reporting some unemployment during the entire year would be 155—180 less the 25 who were unemployed over a 2-month period. Dividing reported weeks of total unemployment by 52 yields the "adjusted" retrospective estimate, which is exactly equal to the annual

---

Exhibit 1. Derivation of annual average unemployment from the monthly CPS and from the annual Work Experience Survey

Based on monthly measurements:

- Annual average unemployment $= \dfrac{180 \text{ reports}}{12 \text{ months}} = 15$

Based on retrospective annual survey:

- Of 155 persons with any unemployment, 130 were unemployed for 1 month (4.33 weeks) and 25 were unemployed for 2 months (8.67 weeks).
- Annual average unemployment =

$$\frac{(130 \text{ persons} \times 4.33 \text{ weeks}) + (25 \text{ persons} \times 8.67 \text{ weeks})}{52 \text{ weeks per year}} = 15$$

average from the monthly survey.

It has previously been noted that these adjusted Work Experience Supplement estimates are usually less than the comparable annual average figures, particularly among women and youth.[2] However, the reasons offered for the overall understatement have been largely conjectural.

One plausible reason for the difference between the two sets of estimates is that respondents to the supplement forget events which took place further in the past. Unless very recent or relatively long, a spell of unemployment might be forgotten by the person who encountered it, and it is even more likely to be overlooked by another household member who may be answering the work experience questions for the entire household. This forgetting should be greater for unemployment which took place long ago than for that which occurred in the recent past.

Two studies on underreporting of past unemployment form the basis for this hypothesis. During 1969–71, the Census Bureau conducted a special reinterview program in which the same respondents were asked labor force questions in 2 consecutive months.[3] The second month's survey included a retrospective interview on events occurring in the first month. Analysis of the results revealed that people did not consistently place themselves in the same labor force categories they had earlier. In particular, *unemployment in the first month was understated significantly in the second interview.* Analysts noted that: "biases in labor force status due to recall are quite high and at an unacceptable level of quality." A follow-up study found the same pattern among both men and women. Apparently, recall errors are a serious problem even over as brief an interval as 1 month.

The question of "recall bias" has also been the subject of an inquiry by Statistics Canada in relation to its retrospective Annual Work Patterns Survey.[4] During January of each year since 1978, the Canadian statistical agency has conducted this supplemental survey, in which respondents are asked labor force questions pertaining to the previous calendar year. The Canadian survey differs from the U. S. Work Experience Supplement in that persons are asked to describe their labor force activities in each of the 12 preceding months. For example, the Canadian respondent actually identifies "July" as a month in which he or she worked or looked for work. When Canadian analysts compared the answers to these retrospective questions to their ongoing monthly labor force surveys, they found a "substantial, systematic recall bias." *In the early months of the year,*

Table 1. Comparison of adjusted Work Experience Survey unemployment with annual average of monthly unemployment from the CPS, 1967–79

[Numbers in thousands]

Year	Annual unemployment data from Work Experience Survey: Total with unemployment during the year (1)	Average duration of unemployment (in weeks) (2)	Adjusted estimate of weekly unemployment[1] (3)	Annual average of CPS unemployment for a typical week (4)	Percent understatement[2] (5)
1967	11,561	10.05	2,234	2,976	24.9

Average	5,162	4,978	2,834	2,534	2,328	2,447

unemployment is seriously understated, with the bias declining and then reversing towards the end of the year. That is, some of the unemployment in January of the previous year is "forgotten," while recent unemployment in December is overstated.

Because the U. S. Work Experience Supplement relies on recall of events which took place as much as 15 months earlier, it seems logical to expect the forgetting of past unemployment to affect this survey as well. The following discussion illustrates one method with which this intuitive expectation can be tested.

A new look at retrospective bias

Table 1 lists annual averages from the monthly surveys and the adjusted supplement estimates for the years 1967–79. As previously indicated, the retrospective unemployment figures from the supplement are consistently less than the annual averages from monthly data. For the labor force as a whole, the degree of understatement ranged from about 9 to 25 percent and averaged 19.1 percent over the period.[5] The understatement appeared to be smaller during periods of increasing unemployment, such as 1974–75.

The annual averages in table 1 treat each month equally, in the sense that each month constitutes one-twelfth of the average. If the Work Experience survey provided completely parallel estimates of both the incidence and total duration of unemployment, figures from the supplement and from the monthly surveys should be exactly equal. Because the annual averages weight each month equally, it is perfectly acceptable to combine the monthly data into two sets—January through June, and July through December—and treat them each as contributing one-half the annual average. While this treatment is nothing more than a mathematical identity, it provides a convenient tool which may be used to examine the retrospective bias of the March supplement. That is, each half year average of monthly information can be examined for correspondence with the Work Experience data.

Table 2 shows the 6-month averages of monthly unemployment figures for the total, and by sex, for the 1967–79 period. In general, total unemployment has been greater during the 6 six months of the year. Note, however, that this does not hold for women, who report higher levels of unemployment during the last 6 months.

Because the corresponding adjusted supplement figures (not shown) all fall below these half-year averages, a simple comparison of the data would make it appear that the 6-month period with lower observed unemployment is "closer" to the Work Experience estimates. For men, the second half of the year is "more similar" to the supplement figures, while the first-half averages are closer for women.

Obviously, each of the 6-month averages contributes one-half to the annual average. If the adjusted supplement count is exactly analogous to the annual average of monthly data, then it too should be a composite of the two periods. That is, given:

$$(1)\quad \text{Annual average unemployment} \equiv (0.5)\ \text{January-June 6-month average} + (0.5)\ \text{July-December 6-month average}$$

and

$$(2)\quad \text{Annual average unemployment} = \text{Adjusted Work Experience unemployment}$$

then

$$(3)\quad \text{Adjusted Work Experience unemployment} = (0.5)\ \text{January-June 6-month average} + (0.5)\ \text{July-December 6-month average}$$

A simple test is proposed to examine this relationship. The adjusted Work Experience figure, W_e, is regressed on the two 6-month averages as:

$$W_e = a + b_1\,(JJAV) + b_2\,(JDAV) + u$$

where a is a constant term, JJAV is the 6-month average of the unemployment counts for January through June, JDAV is the average for July through December, and u is the disturbance term, assumed to be independently distributed, with a zero mean and constant variance.

Because both halves of the year should figure equally into the cumulative total, we should expect $b_1 = b_2$. More specifically, if the adjusted supplement unemployment were an exact measure of the incidence and the length of unemployment, we should find $a = 0$, and $b_1 = b_2 = 0.5$. That is, there would be no understatement, and each half of the year would count equally towards the cumulative total. This should hold regardless of any size differences in unemployment between the two halves of the year.

Table 3 shows the coefficients obtained when the relationship was tested on total, male, and female unemployment. The differences between expectations and the results of this simple test are stunning.

In each case, the second half of the year appears to have much more weight in the adjusted supplement estimates than the first half. The coefficients for the second half of the year are all greater than 0.5, and are significantly related to the degree of unemployment reported in the Work Experience Supplement. On the other hand, the coefficients for the first half of the year indicate little relationship at all; no estimate of b_1 was significantly different from zero at a 90-percent confidence level. All of the second-half coefficients are at least four times as great as those of the first half.

These results seem to support the contention that unemployment in the first half of the year is "forgotten" in the Work Experience Supplement relative to the more recent second half, which is closer to the week in March when supplement questions are asked. The Work Experience data still unexplainably understate the unemployment of certain demographic groups by differential amounts. However, the foregoing analysis indicates that recall bias does play an important part in the general shortfall, which appears strongly in evidence even when the data are disaggregated by sex. □

Table 3. Regression of adjusted Work Experience unemployment on half-year averages of monthly unemployment from the CPS, 1967–79

[t-statistics in parentheses]

Adjusted Work Experience unemployment	Estimates of—			R^2
	a	January-June coefficient b_1	July-December coefficient b_2	
Total	–416.30 (–2.20)	0.07 (0.53)	0.84 (5.34)	0.96 —
Men	–107.28 (–1.17)	.16 (1.64)	.81 (6.26)	.98 —
Women	–222.93 (–1.78)	.06 (0.25)	.73 (2.96)	.96 —

[2] Richard D. Morgenstern and Nancy S. Barrett, "The Retrospective Bias in Unemployment Reporting by Sex, Race and Age," *Journal of the American Statistical Association*, June 1974, pp. 355–57; and Wayne Vroman, "Measuring Annual Unemployment," Unpublished paper (Washington, The Urban Institute, 1979).

[3] See Louis E. Williams, "Methods Tests Phase III, First Report on the Accuracy of Retrospective Interviewing and Effects of Nonself Response on Labor Force Status," Memo, Bureau of the Census, June 24, 1969; Charles Jones and Robert Aquilino, "Methods Tests Phase III, Second Report . . .," Memo, Bureau of the Census, Jan. 29, 1970; and Robert Aquilino, "Methods Tests Phase III, Third Report . . .," Memo, Bureau of the Census, Apr. 2 1971. These special studies should not be confused with the regular CPS reinterview program, in which a percentage of households are reinterviewed as a quality check on the data. The special program allowed separate study of proxy response versus self-response, as well as "recall" bias.

[4] For a description of the Canadian Annual Work Patterns Surveys and selected data from them, see *Patterns of Full- and Part-Year Employment and Unemployment: Results From the Annual Work Patterns Surveys for 1977 to 1980* (Statistics Canada, Catalog No. 71-531, forthcoming).

[5] These figures are slightly higher than estimates provided by Barrett and Morgenstern, and Vroman. One reason for the difference is that this study used unpublished Work Experience data which shows finer detail for duration-of-employment intervals. The midpoints of the most detailed interval size available were used for all years. For the open-ended interval, "40 weeks or more" of unemployment, 44 weeks was used as the midpoint, rather than 46. The procedure indicated was used by Morgenstern and Barrett in the original article on unemployment underreporting. Unpublished information on persons unemployed 27–39 weeks was also used.

Easing the hardship of plant shutdowns

The Bureau of Labor Statistics' 1980–81 study of major collective bargaining agreements found that companies are providing more protection for covered employees affected by plant shutdowns and movements, greater opportunities for interplant transfers, and more frequent relocation allowances. The study reviewed 1,593 agreements, each covering 1,000 workers or more in private industry, excluding railroads and airlines.

Among a sample of 522 of the contracts, 36 percent placed some restriction on management's right to close or relocate plants—up from 22 percent in a 1966–67 study. Although the majority of the sample agreements were in the nonmanufacturing sector, more than two-thirds of the contracts imposing restrictions were in manufacturing.

Interplant transfer provisions were included in 552, or 35 percent, of the 1,593 contracts surveyed. Such clauses appeared in 37 percent of the manufacturing agreements, and 33 percent of those in nonmanufacturing. When a similar study was conducted 13 years earlier, 32 percent of all agreements dealt with interplant transfers.

In 1980–81, provisions that required a company to pay all or part of an employee's relocation expenses were found in 41 percent of the agreements having interplant transfer clauses, compared with 34 percent in 1966–67. In manufacturing, 36 percent of the contracts specified these payments, compared with 46 percent in nonmanufacturing.

The detailed report on the study, *Major collective bargaining agreements: plant movement, interplant transfer, and relocation allowances,* BLS Bulletin 1425–20, is available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Price $4.75. □

Bilateral protection

The mutual accommodations and adjustments to the hard issues of collective bargaining that the parties have displayed in regard to wages, employee benefits, and institutional issues is no less in evidence when one inspects the current status of the administrative issues in our labor-relations system. Management has increasingly recognized the job-protection and working-condition problems of the industrial employee and has made important concessions in these areas. At the same time, however, there has been reciprocal recognition on the part of unions that the protection of the employee cannot be at the expense of the destruction of the business firm. The axiom that employees cannot receive any protection from a business that has ceased to exist appears to have been fully appreciated by all but the extreme recalcitrants of the labor movement, and workable compromises have been possible with respect to the areas of seniority, discipline, and the various other dimensions discussed no less than in the case of previous topics.

Developments in Industrial Relations

Second round of concessions at Uniroyal

The 4,200 Uniroyal, Inc., employees represented by the Rubber Workers have agreed to a second round of wage and benefit concessions expected to save the company $54.9 million. The first round, in July 1980, totaled $40 million. (See *Monthly Labor Review*, September 1980, p. 60.) Although Uniroyal earned a profit of $38.7 million during the first 9 months of 1981, compared with a $12.5 million loss during the first months of 1980, the company said the latest concessions were needed to further its "long-term plan for financial viability." Uniroyal also said the concessions will reduce the possibility that it will have to sell any of its operations to obtain money to strengthen its "core" operations.

Under the new concession accord, the union agreed to accept the same new contracts as the union negotiates with other major rubber companies when current agreements expire on April 20, 1982, modified to provide for up to $10 million a year less in wage and benefit improvements. They also agreed to continue the suspension of 69 cents an hour in cost-of-living adjustments that was initiated as part of the 1980 concession settlement (this amounts to about $8.3 million dollars a year, including the impact on those benefits that change when wages change).

There was speculation that the action would lead the other companies to press the union for concessions to maintain their competitive position relative to Uniroyal, even though their compensation costs are reportedly about $5 an hour less than Uniroyal's. These companies have won concessions at a few plants but not on a companywide basis as at Uniroyal.

In return for the union concessions, Uniroyal agreed to—

- Study its work force to determine if it has too many salaried employees.
- Establish a joint council to discuss mutual problems.
- Permit union president Milan Stone to make annual presentations to the company's board of directors.
- Open its financial records to the union.
- Establish a profit-sharing plan.
- Seek comparable wage and benefits concessions from other unions that represent some of its employees and to impose cuts on nonunion employees.

Gulf contract sets pattern for petroleum industry

Gulf Oil Corp. and the Oil, Chemical and Atomic Workers (OCAW) negotiated a 2-year contract which set a pattern for the petroleum refining, pipeline, and petrochemical industries. The terms covered more than 50,000 workers at 400 facilities owned by 100 companies. The only work stoppages were at the Texaco, Inc., and American Petrofina refineries in Port Arthur, Tex., where the companies declined to extend the current agreements on a day-by-day basis, pending completion of negotiations. The Texaco negotiations were further complicated by company efforts to reduce the lump-sum amount employees may choose to receive at retirement in lieu of receiving regular monthly pensions.

The Gulf accord provided for a 9-percent wage increase in January 1982 and for a 90-cent-an-hour increase in January 1983 that will average about 7.1 percent. The union did not win its demand for a no-layoff clause to protect workers from the recent job cutbacks that have hit the industry. According to union president Robert F. Goss, the companies have closed 50 facilities since 1980, eliminating 5,000 jobs in OCAW bargaining units. The industry is currently operating at about 70 percent of capacity.

The contracts also provide for the employers to raise their obligation for family health benefits by $17.50 a month in the first year and $13.50 in the second, bringing the total to $151.50 at Gulf. Gulf employees, who had been paying $30 a month, will pay the full amount of any increase in premium above $151.50. Gulf's obligation for single employees' health benefits also was raised, by $6 a month in the first year and $4 in the second. Gulf previously paid $47 a month, which covered the full premium cost for these employees.

The agreements also call for the companies that have instituted pension improvements for nonunion employees to extend those improvements to unionized employ-

---

"Developments in Industrial Relations" is prepared by George Ruben and other members of the staff of the Division of Developments in Labor-Management Relations, Bureau of Labor Statistics, and is largely based on information from secondary sources.

ees. Among the companies that settled were Cities Service, Exxon, Shell, and Arco.

Shipyard employees paid for settling early

After 3 months of negotiations, General Dynamics Corp.'s Electric Boat Division and 11 unions agreed on a 3-year contract that supersedes the balance of a contract scheduled to expire July 1, 1982. In return for settling early, the 12,000 covered employees at the Groton, Conn., shipyard received a 25-cent-an-hour wage increase effective January 3. On July 1, 1982, they will receive an increase ranging from 20 cents an hour for those in the lowest pay grade to 75 cents for those in the highest grade, followed by a 30- to 65-cent increase July 1, 1983, and a 30- to 60-cent increase on July 1, 1984. All employees will also receive a 10-cent cost-of-living adjustment on November 27, 1983, and December 2, 1984, regardless of the movement of the Consumer Price Index. Prior to the settlement, pay rates ranged from $4.75 for certain accounting clerks to $10.83 for some skilled trades workers, with about 70 percent of the workers clustered at the $8.97 rate for first class mechanics.

The agreement also provided for each employee to receive a $100 payment in settlement of several thousand grievances they had filed over job assignments; a $2 increase in the pension rate, raising the amount to $14 a month for each year of credited service; adoption of a "magic 85" pension clause permitting workers to retire when their age and years of service total 85; and a change in the investment plan permitting employees to invest 10 percent of their earnings, instead of the previous 4 percent, with the company continuing to match half the amount.

Employee concessions aid steel company

McLouth Steel Corp.'s efforts to reorganize its operations under protection of Federal bankruptcy laws were aided when its 3,000 employees represented by the Steelworkers agreed to give up a 15- to 47-cent an hour wage increase scheduled for October 1982, all of the quarterly cost-of-living adjustments that would normally be effective in 1982, and $1.45 in wage increases that had gone into effect in the last 5 months of 1981. They also voted to give up 3 of the 11 holidays scheduled for 1982, and a week of vacation. McLouth estimated that the changes would save about $14 million in labor costs in 1982.

The settlement provides for restoration of wages and benefits to the proper level at the end of 1982—subject to court approval—if McLouth resumes dividend payments. The company lost about $40 million in 1981, compared with $56 million in 1980.

In conjunction with the settlement, McLouth announced a 27.5-percent reduction in its nonunion work force. A 10-percent pay reduction and a cut in paid vacation also were imposed on the retained nonunion employees.

Many of McLouth's problems resulted because the severe decline in automobile sales in the last few years has reduced the demand for flat-rolled steel, the company's major product.

Court bans withdrawal from multiemployer talks

In a 5 to 4 decision, the Supreme Court held that a contract bargaining stalemate does not justify employer withdrawal from a multiemployer collective bargaining association. The ruling validated the position of the National Labor Relations Board, which permits employers to withdraw before contract bargaining begins, but permits withdrawal only in "unusual circumstances" during the talks. Generally, the board has held that bargaining impasses and strikes are not unusual circumstances.

The court's ruling was in accord with the position of most unions, which view the prohibition of employer withdrawals as vital to the collective bargaining process. On the other hand, employers generally contend that the prohibition gives unions an unfair advantage and will reduce the number of firms joining multiemployer units.

The case arose in 1975 when Charles D. Bonanno Linen Service, Inc. of Medford, Mass., attempted to withdraw from an association of linen supply companies after bargaining with a Teamsters local reached an impasse, leading to a strike against the Bonanno company and a lockout of employees by the other companies.

Plumbers accept lower pay

In the Portland, Oreg., area, members of Plumbers Local 51 agreed to lower compensation for residential and repair work to counter a 38-percent unemployment rate for the local's 900 members. The manager of one plumbing company said the action will enable him to compete more effectively with nonunion companies by reducing the cost for a service call to $35–$40, from the $48.90 "break even" rate previously charged.

The new $14.39-an-hour compensation level the local negotiated with the Plumbing, Heating and Contractors Association consists of $12.25 in pay and $2.14 in employer payments for various benefits. The previous $23.74-an-hour level ($20.08 in pay and $3.66 for benefits) continues to apply to commercial work. □

Book Reviews

Jevons, labor, and the state, 100 years later—a centennial essay

H. M. DOUTY

W. Stanley Jevons' *The State in Relation to Labour*[1] appeared in 1882, the year of his death by drowning at the age of 46 off the south coast of England. Milton R. Konvitz, then professor of industrial and labor relations and of law at Cornell University, observed in 1948 that this book, together with some related lectures, " . . . will always have significance for persons concerned with principles of social legislation and the theoretical aspects of labor relations."[2]

The appearance of Jevons' book was one indication, among many, that the final quarter of the 19th century, and perhaps the 1880's in particular, marked ideological and institutional turning points for labor in the economies of both Great Britain and the United States.[3] In essence, the book provided a case for limited government intervention in the labor market within the confines of a generally competitive economic system. It also contained analyses of particular issues, such as arbitration and conciliation in labor disputes, that have not lost their force. Such general observations as, "All classes of society are trade-unionist at heart, and differ chiefly in the boldness, ability, and secrecy with which they push their respective interests" have a distinct air of modernity. In his preface, Jevons acknowledges indebtedness to two Americans, Joseph D. Weeks and Francis A. Walker, and there is a text citation to a study coauthored by Carroll D. Wright, then chief of the Massachusetts Bureau of Labor Statistics, and later the first U.S. Commissioner of Labor Statistics. Jevons was well known in academic circles in the United States, and *The State in Relation to Labour* circulated here.

Jevons was a man of extraordinary ability. He occupies a secure position in the history of economic doctrine through the development in his *Theory of Political Economy* (1871) of the marginal utility theory of value. But his interest also extended to a wide range of economic and social problems of his day. His first substantial publication (1865) dealt with the extent to which British industrial power rested on the exhaustible resource of coal. His investigations of problems of currency and finance, and of seasonal and cyclical movements in business activity, were inductive studies representing an immense achievement at a time when statistical data were hand-tabulated. In his monetary studies, Jevons solved virtually all the basic problems in the construction of price indexes.

Early in life, Jevons evidenced an interest in the working poor. His *Letters and Journals* (edited by his wife, 1886) indicate that Jevons, during his first years at University College in the early 1850's, took long walks through the poorest parts of London in an effort to gain practical insight into their condition. He continued to take such walks in Sidney, Australia, where, from 1853 to 1858, he worked as assayer at the mint, after the bankruptcy of his father's firm interrupted his formal education. Among his early projects, of which apparently only fragments were completed, were social studies of London and Sidney. More than a quarter of a century was to elapse before the appearance of his only major work relating directly to labor.

In *The State in Relation to Labour*, Jevons begins with a chapter on the principles of industrial legislation. A firm believer in individual liberty, he nevertheless suggests that a difficult question arises "whether, out of respect to some supposed principle of individual liberty, the state ought to allow men to go on working and living in the midst of needless risks." He concludes that "the first step must be to rid our minds of the idea that there are any such things as abstract rights, absolute principles, indefeasible laws, inalterable rules, or anything whatever of an eternal and inflexible nature." He draws a useful distinction between science, as embodied in general economic principles, and the adaptations and exceptions to principles that may be necessary for the practical betterment of society.

As a Benthamite, Jevons argues that the state is justified in passing any law "which, without ulterior consequences, adds to the sum of total happiness." Social

legislation "becomes a complex calculus of good and evil. All is a question of probability and degree."

Jevons warns that legislation should be approached cautiously in an effort to anticipate its consequences. It should be rooted in experience and, if possible, based upon direct experiment. He cites the Poor Law Reform of 1834 as an instance of legislation based upon much empirical evidence, and Robert Owen's humane treatment of the workers in his cotton mills in New Lanark as an experiment that greatly contributed to the origin of the Factories Acts. Surely Jevons would have approved of recent experiments in this country with income maintenance programs.[4] Other "experiments" relating to proposed labor legislation can be imagined. After legislation has been enacted, Jevons holds that "the common practice of . . . remedying its mistakes, oversights, omitted cases, inconveniences, or unforeseen wrongs in successive amendment acts is really an application of the tentative or experimental method."

Jevons points to the need, in effect, for cost-benefit analysis in the enactment of social legislation. It is necessary not only to show, by evidence or direct experiment, that a measure will add to the sum of happiness within the community, but that there will not be an equivalent or greater subtraction of happiness. He believes this second factor is the more difficult to determine, but something for which science may offer some general guidance to the legislator, who "must gather to a focus the complex calculus of probabilities, the data of which are supplied by separate investigators." In the case of social legislation, the science primarily involved is economics, but the legislator should not "attribute exclusive value to the economic probabilities, and overlook moral, sanitary, political, and other probabilities."

After a discussion of general principles, Jevons considers the practical application of legislation as it relates to the liberty of the citizen. He begins with legislation for the inspection of certain commodities such as butter and meat, for weights and measures, and for sanitation. In these cases, the general criterion is the ability of the purchaser or consumer to make an informed judgment. Where this ability is poor or lacking altogether, there is room for government intervention, which, if judiciously undertaken, may increase rather than diminish the liberty of the individual.

A similar effect may result from state intervention in the labor market. Jevons notes that in England prior to the 19th century, "Legislation with regard to labour has almost always been class legislation . . . the effort of some dominant body to keep down a lower class, which had begun to show inconvenient aspirations." The Factories Acts, which had their origin in 1802, were different. He terms their consolidation in 1878 "one of the brightest achievements of legislation in this or any other country." This legislation had gradually improved the hours of work of children, young people, and women in manufacturing employment. Jevons justifies this legislation on the pragmatic grounds that its effects on health, the education of children, and the family enhanced general social well-being. He argues further that the principle of individual liberty would not preclude state imposition of labor standards on behalf of men, where, as in factory employment, workers must conform, in terms of working conditions, to the wishes of the majority, the will of the employers, or the customs of the trade "if it could be clearly shown that the existing customs are injurious to health, and that there is no other possible remedy."

Jevons presented a case, in light of 19th century conditions, for the prohibition of factory employment of married women, especially those with young children. Out of such work, he wrote, "arises a considerable part of the shocking infantile mortality prevailing in many parts of the manufacturing districts, accompanied by much immorality and intemperance not unnaturally produced by the destruction of home influences." He cites at some length a report on this subject issued in 1875 by the Massachusetts Bureau of Labor Statistics.

Jevons' discussion of trade union legislation is preceded by an analysis of the economics of wage determination, drawing in part upon the work of the American economist, Francis A. Walker. He concludes that "the rate of wages which workmen can demand will depend upon the relation of supply to demand of [each] particular kind of labour. The demand depends upon the expected value of the produce." He explicitly rejects the wages fund doctrine. There is certainly a foretaste of current human capital theory in his observation that one can argue, "In his education and training a skilled operative expends no small amount of capital, which remains invested in him, to be repaid by an annuity of higher wages during his available working life." But he rejects this argument when it involves restrictions on entry to employment, except where necessary in the public interest to ensure adequate worker training. His general view is that "whosoever tries to raise his own wages by preventing other persons from working at his trade, and thus makes his own kind of labour scarce, attempts to levy contributions from other people. It is simply a case of private taxation."

One might suppose that Jevons, in light of his general position on the adverse effects of trade restraint, would be sympathetic to state action to curb trade union intervention in the labor market. But, for two reasons, he rejects any return to the Combination Laws, which were intended for this purpose, and which had been effectively repealed many years earlier. The first reason was practical—"Our grandfathers and great-grandfathers, not to speak of earlier ancestors, did their best to crush all societies of working men, and ignominious was their failure. Are we likely to succeed better when the working-class order has become immensely increased in numbers, and increased almost equally in intelligence, organization, wealth, and general resources?" The second reason was that the prohibition of trade unionism, even if possible, "would suppress with much evil many germs of good." Jevons expresses approval of legislation, enacted in 1871 and 1876, that enabled British unions to register as friendly societies and thus secure protection of their funds and other property.[5]

At the same time, in a brief but interesting analysis, he assigned a minor role to strikes as a factor in wage advance, citing other causes, including changes in technology and in the capital-labor ratio, that had influenced the upward movement in wages in Great Britain in recent years. He pointed out that the rise in wages had been general, and had extended to mercantile and bank clerks, government employees, and other unorganized groups of workers. The law of supply and demand had even operated advantageously for "domestic servants, an exceedingly numerous class of persons quite devoid of organization, and often of an age and character little suited, it might be thought, to enforce concessions."

Jevons' book concludes with chapters on the law of industrial conspiracy, which considers the implications of the substantial repeal, in 1875, of the old common law doctrine regarding industrial disputes; on cooperation and industrial partnership, where profit-sharing is suggested as the ultimate solution to labor-management conflict; and on arbitration and conciliation. On arbitration, Jevons comes out strongly for grievance or rights arbitration, as now found almost universally in labor-management contracts in the United States but not in Britain. However, he argues against interest arbitration, because in the settlement of new contract terms, "There can be no certainty that the arbitrator knows better than the other parties." He sees, however, an important role for conciliation, and remarks that "a trade dispute, especially when it has reached the acute phase of a strike, has little or nothing to do with economics . . . and there is no theoretic reason why conciliators should not be called in, if experience shows that they are usually able to compose matters." He cites an 1879 report on arbitration and conciliation in England by an American, Joseph D. Weeks, as "probably the most valuable document published on the subject, describing both the successes and failures of the system," and an 1881 report on the same subject, also by Weeks, relating to New York, Ohio, and Pennsylvania. Jevons' final suggestion is that "in all probability success will best be obtained in the settlement of trade disputes by keeping lawyers and laws as much at a distance as possible."

Jevons wrote with admirable clarity. His small book on the role of the state in labor standards and labor relations was intended primarily for the lay reader. It presented a case for legislative intervention in the industrial relations process, based upon the careful accumulation and evaluation of evidence and, if possible, the use of experimentation, and divorced, to use John Stuart Mill's terminology when he repudiated the wages fund doctrine, from the unbending necessities of political economy. As such, it helped usher in the modern era in industrial relations in both Great Britain and the United States. In this country, it was cited as late as 1905 as supplementary reading in the admirable text on labor problems by Thomas Adams and Helen Sumner.[6] And after 100 years it can still be read with interest and profit. □

FOOTNOTES

[1] W. Stanley Jevons, *The State in Relation to Labour* (London: Macmillan, 1882). The book went through four editions, the most recent in 1910.

[2] See Milton R. Konvitz, "An Empirical Theory of the Labor Movement: W. Stanley Jevons," *The Philosophical Review*, January 1948, p. 60.

[3] In terms of ideology, a major development was the attack on and gradual abandonment among economists of the wages fund doctrine in both Great Britain and the United States. Institutionally, a relatively stable trade union movement had been created by 1880 in Great Britain through "new model" unions mainly of skilled workers, featuring high dues, sickness and other benefits, and apprenticeship programs. Union legal disabilities had been removed, and protective legislation for women and children in factory employment had been consolidated and improved. In the United States, the 1880's witnessed the meteoric rise and fall of the Knights of Labor, the establishment of the American Federation of Labor as a permanent trade union center, and the growth of labor statistics through State agencies and a Federal bureau.

Probing labor market dualism

Dualism and Discontinuity in Industrial Societies. By Suzanne Berger and Michael J. Piore. New York, Cambridge University Press, 1980. 159 pp. $17.95.

In this work, Michael Piore continues to develop the theory of labor market dualism which he was among the first to articulate in the late 1960's and early 1970's. Here he identifies the sources of dualism as located in the division of labor, the instability of market economies, and the rigidities of large-scale production. Suzanne Berger lends a political dimension to the analysis: a dual labor force is fostered not only by economic conditions requiring cheap labor or the performance of "undesirable" jobs. It is also associated with the survival of "traditional" social classes or strata of small entrepreneurs.

The authors in effect reject conventional (that is, neoclassical) approaches to labor market theory. They hold that the segmentation of labor markets, exemplified by the "internal" labor markets of corporate and government bureaucracies, or by the relegation of racial and national minorities to the less desirable and less stable jobs, cannot be explained by the assumption that individuals seek to maximize their personal well-being in a presumptively competitive society. "In our perspective," they write, "the variations in human behavior and values are explained as responses elicited by different institutions, not as differences intrinsic to the persons who manifest them." Thus, they approach labor market analysis from the demand side. The reactions of workers to their labor market situation are never ignored—Piore devotes long chapters to them in his other recent work, *Birds of Passage*, in which he deals with migrant and immigrant workers, the prime examples of the work force that populates secondary labor markets. Yet, the authors see the dominant force in labor markets as originating among those who organize and control the production process, and in whose interest it is to secure a "variable" labor force so as to complement their "fixed" capital. True, labor, by means of collective bargaining, can to some extent impose the requirement of stable employment. But the persistence, even expansion, of dual labor markets demonstrates the resistance of owners of capital to accept labor as a "fixed" factor. The fragmentation of jobs incident to the division of labor in the workplace represents an added source of demand for "variable" labor: although meant to raise efficiency, the capacity demand for which such fragmentation is ultimately designed cannot be sustained over the business cycle. Labor's struggle for job tenure and job integrity thus tends to be rendered ineffective when it is not repressed. The assumption of a harmony of interests between labor and capital, implied by neoclassical labor market theory, is vitiated.

The dual labor market theory and the conflicts it postulates is akin to aspects of Marxism. Yet, the authors reject the relevant Marxist teachings of struggle between broadly defined classes, inasmuch as their own concerns—the differentiation *within* both the class of workers and the class of capitalists—are not central to Marxism. In fact, the persistence of the "traditional" sector of small, often still craft-based entrepreneurs and, more generally, of a large self-employed middle class in all industrial and industrializing countries has been a puzzle to scholars who accept Marxism as paradigmatic social science. They have conventionally assumed that this strata of capitalist society is doomed to disappear. Berger and Piore in contrast believe that small entrepreneurs constitute a permanent feature of industrial society, essential to its survival. Cleavages, whether they involve racial and national minorities; the traditional and the modern sector; secondary or primary workers; small business or large corporations—cleavages transcend, so the authors argue, the "unitary" forces in importance. Hence they reject the idea of modernization—that is, the notion that social structures in time adapt to the modes of large-scale production and distribution. Likewise, the authors dismiss the idea that industrial societies tend to converge, that is, become similar in structure, for the cleavages mentioned—and they are major themes of the work reviewed here—extend historically across all these societies, and create profound differences in the ways the problems of industrialization are dealt with.

Now these are interesting propositions, but they are not consistently argued. The authors indeed recognize the universality of the sources of labor market dualism, yet they insist that the operation of dual labor markets, and the ways by which they resolve the problems that give rise to them in the first place, are specific to individual societies, hence differ from one society to the other, since value systems and the status of the traditional sector (or its equivalent in such countries as the United States where no traditional sector exists) have undergone different historical evolutions. But why do those problems—uncertainty, cyclical instability, fragmentation of work—occur and recur everywhere, notwithstanding the supposed historical individuality of given societies and social processes? Whence the universality of dual labor markets (or, more generally, of wage labor—a phenomenon that stamps like no other the capitalistic or, to use a more aseptic term, the modern character of industrial societies)? Isn't the historical individuality of the various industrial societies diminished by the supersession of the *universal* processes, of which dual labor markets are one manifestation?

True, Marx was not much concerned about the diversity and segmented nature of labor markets; nor were any of his contemporaries. However, he established the centrality of wage labor to industrial society and its development. This development stems from the accumulation of capital. The accumulation of capital is essentially intolerant of national borders and cultural barriers to its expansion. It is a process that subordinates "cleavages," rather than being subordinate to them. As Piore and Berger themselves show, labor market segmentation and secondary labor markets represent decidedly subordinate processes; they arise from the recurrent need to deal with the rigidities and uncertainties generated by the industrial system. It is not precluded that the progressive cheapening of the supply of labor that is associated with the spread of dualism will gradually undermine some of the foundations of industrialism (for example, consumer durables manufacture). But if as this happens, the primary labor force should shrink, and the secondary labor force come to dominate the labor market, which would thus lose its "dual" character, a new epoch in the evolution of the labor market would emerge.

Both authors cite the events in Italy in 1969, when widespread industrial protests and strikes transformed labor-management relations. These could no longer be confined to wage issues, they now began to involve broadranging negotiations which, for the first time, concerned work discipline, promotion and discharge, work allocation, as well as work content and technology, as matters bearing upon job satisfaction. All this spelled a shift of power to the workers and their organizations, and a corresponding loss of management control over the production process. For example, management was rendered unable to discipline workers for infractions of work rules or tardiness, or to institute layoffs when demand slowed. "The response of management to this rigidification has been an effort to restore its flexibility by transferring productive activity to a secondary sector." In time, this meant what Berger calls a "massive decentralization of industrial production." What effects this shift had upon the primary work force, Piore and Berger do not discuss, but it surely weakened it gravely.

Management's ability to weaken the primary work force which it employs is often noted by Piore. It undermines his argument bearing on the cleavage within the working class and raises questions about the validity of the entire dual labor market theory. At the risk of repeating some thoughts alluded to earlier, I quote from Piore's *Birds of Passage*, where he comments upon labor's unceasing effort to impose "upon the system the obligation to treat it . . . like a fixed factor"—so that it cannot be used to compensate for market-caused instabilities in demand, nor for efficiency-related changes in the workplace. But management resists this effort and labor remains unable to dominate the process of production so as to safeguard its interests. Where it does begin to succeed, the burden of rigidity and uncertainty may be shifted to a secondary work force (the role assumed by migrants and immigrants in *Birds of Passage*, but by broader strata in the book here reviewed). It may well be that organized labor often helps promote this shift so as to secure the tenure of its members. But its primary position is not necessarily assured thereby. This, Piore himself confirms, pointing to such management practices as avoidance of permanent hiring by using temporary help; subcontracting; long probation periods; locating of plants in nonunion areas; and hiring of youths and women, who appear to have a lower propensity than men to join unions. The status of the primary work force is thus, if not uniformly threatened, certainly at risk. The differentiation between a primary and secondary work force—already made less sharp by Piore's dividing the primary work force into two or three segments characterized by a hierarchy of intellectual skills—loses force.

Piore also theorizes on the technological foundations of dual labor markets. There are many interesting observations in the pertinent chapter, but his argument is not clear; a case for the existence of a "dualistic" technology is not convincingly set forth. As I understand it, the argument briefly runs as follows: Adam Smith related the division of labor in the workplace—and therefore productivity—to the expansion of the market. That is, the division of labor would become ever more refined, and productivity would rise, as the market expanded. The worker would innovate labor-saving apparatus as he became more specialized, permitting further increases in productivity. Smith's theory did not leave room for demand uncertainty and instability. The large-scale enterprise, which the extent of the market eventually permitted and required, adjusts to demand uncertainty by attuning its output to only the stable segment of the market, leaving the unstable segment to smaller firms. The "technological base for duality" resides in the declining average cost curves of the large firm and the traditional U-shaped average cost curves of the smaller firm. There is much evidence for the validity of the proposition that there are stable and unstable segments of demand, and I will not dwell upon this question. However, it is not at all clear how this technological dualism is related to the duality of the labor market.

Insofar as the concepts of the primary and the secondary labor market have anything to do with skill hierarchies, one could, in fact, argue the opposite of what is implied by Piore—namely that the rise of manufactures signified the rise of a "secondary" work force that gradually displaced the "primary" work force of artisans and craftsmen. Smith's famous example of the pin factory demonstrates what the division of labor meant in terms of simplifying and thus deskilling the task of the worker. Yet, this became the dominant trend in manufacturing, a trend that was accentuated as machinery was introduced, which the great mass of workers tended and only a minority of workers and engineers built. The introduction of assembly lines simply continued the trend toward simplification of tasks. Job specialization and task simplification have been pervasive tendencies in all commercialized industrial and service activities; they do not appear to be related to labor market dualism. Nor is size of enterprise necessarily a *characteristic of such dualism:* until perhaps the mid-1940's, ladies' garment workers would have had to be counted among "primary" workers despite the small size of the firms for which they worked, thanks chiefly to the strength of their union and the ethnic homogeneity of its membership. The evolution of the ladies' garment work force and of its conditions does, however, illustrate another aspect of Piore's theory: the industry's average hourly wage declined from above 100 percent of the total nondurables average in the 1940's to 75 percent in the mid-1970's, as plants located in areas where the union was weak or could not organize.

The conception of labor market dualism originated in a search to explain low wages and job instability among minorities in the late 1960's and early 1970's. Workers in the primary sector appeared then to be much more secure in their tenure than today. The theory could not likely have been formulated in the 1930's when unemployment, job instability, and low pay was the lot of a very large proportion of workers. The line between primary and secondary labor markets will probably again blur, as workers in the primary sector—for example, in automotive and steel manufacturing—are drawn into the maelstrom of insecurity.

35. Wage and benefit settlements in major collective bargaining units, 1976 to date 94
36. Effective wage rate adjustments in major collective bargaining units, 1976 to date 95
37. Work stoppages, 1947 to date 95

NOTES ON CURRENT LABOR STATISTICS

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics. A brief introduction to each group of tables provides definitions, notes on the data, sources, and other material usually found in footnotes.

Readers who need additional information are invited to consult the BLS regional offices listed on the inside front cover of this issue of the *Review*. Some general notes applicable to several series are given below.

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might otherwise mask short-term movements of the statistical series. Tables containing these data are identified as "seasonally adjusted." Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years.

Seasonally adjusted labor force data in tables 2–7 are revised in the March 1982 issue of the *Review* to reflect experience through 1981. The original estimates have also been revised to 1970 to reflect 1980 census population controls.

Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X-11/ARIMA, which was developed at Statistics Canada as an extension of the standard X-11 method. A detailed description of the procedure appears in *The X-11 ARIMA Seasonal Adjustment Method* by Estela Bee Dagum (Statistics Canada Catalogue No. 12-564E, February 1980). The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. Revisions of historical data continue to be made only at the end of each calendar year.

Annual revision of the seasonally adjusted payroll data in tables 11, 13, 16, and 18 begins with the August 1980 issue using the X-11 ARIMA seasonal adjustment methodology. New seasonal factors for productivity data in tables 33 and 34 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The resulting values are described as "real," "constant," or "1967" dollars.

Availability of information. Data that supplement the tables in this section are published by the Bureau of Labor Statistics in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule given below. The *BLS Handbook of Labor Statistics*, Bulletin 2070, provides more detailed data and greater historical coverage for most of the statistical series presented in the *Monthly Labor Review*. More information from the household and establishment surveys is provided in *Employment and Earnings*, a monthly publication of the Bureau, and in two comprehensive data books issued annually—*Employment and Earnings, United States* and *Employment and Earnings, States and Areas*. More detailed information on wages and other aspects of collective bargaining appears in the monthly periodical, *Current Wage Developments*. More detailed price information is published each month in the periodicals, the *CPI Detailed Report* and *Producer Prices and Price Indexes*.

Symbols

p = preliminary. To improve the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
r = revised. Generally this revision reflects the availability of later data but may also reflect other adjustments.
n.e.c. = not elsewhere classified.

Schedule of release dates for major BLS statistical series

Series	Release date	Period covered	Release date	Period covered	MLR table number
Productivity and costs:					
Nonfinancial corporations	March 1	4th quarter	....	....	31–34
Nonfarm business and manufacturing	....	....	April 29	1st quarter	31–34
Employment situation	March 5	February	April 2	March	1–11
Producer Price Index	March 12	February	April 9	March	26–30
Consumer Price Index	March 23	February	April 23	March	22–25
Real earnings	March 23	February	April 23	March	14–20

EMPLOYMENT DATA FROM THE HOUSEHOLD SURVEY

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 60,000 households beginning in May 1981, selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons are (1) those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population; the **total labor force** includes military personnel. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons retired, those engaged in their own housework, those not working while attending school, those unable to work because of long-term illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy.

Full-time workers are those employed at least 35 hours a week; **part-time workers** are those who work fewer hours. Workers on part-time schedules for economic reasons (such as slack work, terminating or starting a job during the week, material shortages, or inability to find full-time work) are among those counted as being on full-time status, under the assumption that they would be working full time if conditions permitted. The survey classifies unemployed persons in full-time or part-time status by their reported preferences for full-time or part-time work.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data presented in table 1. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings*.

Data in tables 2–7 are seasonally adjusted, based on the seasonal experience through December 1981.

1. Employment status of the noninstitutional population, 16 years and over, selected years, 1950–81

[Numbers in thousands]

Year	Total noninstitutional population	Total labor force		Civilian labor force						Not in labor force

NOTE: Effective with January 1982 data, population counts derived from the 1980 census are incorporated into the estimation procedures used in the Current Population Survey. Data for 1970-81 have been revised. Also, seasonally adjusted data have been revised based on the seasonal experience through December 1981.

EMPLOYMENT, HOURS, AND EARNINGS DATA FROM ESTABLISHMENT SURVEYS

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by 166,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

LABOR TURNOVER DATA in this section are compiled from personnel records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies. A sample of 40,000 establishments represents all industries in the manufacturing and mining sectors of the economy.

Definitions

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 14–20 include production workers in manufacturing and mining; construction workers in construction; and nonsupervisory workers in transportation and public utilities, in wholesale and retail trade, in finance, insurance, and real estate, and in services industries. These groups account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to eliminate the effects of price change. The **Hourly Earnings Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries. **Spendable earnings** are earnings from which estimated social security and Federal income taxes have been deducted. The Bureau of Labor Statistics computes spendable earnings from gross weekly earnings for only two illustrative cases: (1) a worker with no dependents and (2) a married worker with three dependents.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

Labor turnover is the movement of all wage and salary workers from one employment status to another. **Accession rates** indicate the average number of persons added to a payroll in a given period per 100 employees; **separation rates** indicate the average number dropped from a payroll per 100 employees. Although month-to-month changes in employment can be calculated from the labor turnover data, the results are not comparable with employment data from the employment and payroll survey. The labor turnover survey measures changes during the calendar month while the employment and payroll survey measures changes from midmonth to midmonth.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of June 1981 data, published in the August 1981 issue of the *Review.* Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Complete comparable historical unadjusted and seasonally adjusted data are published in a Supplement to Employment and Earnings (unadjusted data from April 1977 through March 1981 and seasonally adjusted data from January 1974 through March 1981) and in *Employment and Earnings, United States, 1909–78,* BLS Bulletin 1312–11 (for prior periods).

Data on recalls were shown for the first time in tables 12 and 13 in the January 1978 issue of the *Review.* For a detailed discussion of the recalls series, along with historical data, see "New Series on Recalls from the Labor Turnover Survey," *Employment and Earnings,* December 1977, pp. 10–19.

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review,* December 1969, pp. 9–20. See also *BLS Handbook of Methods for Surveys and Studies,* Bulletin 1910 (Bureau of Labor Statistics, 1976).

The formulas used to construct the spendable average weekly earnings series reflect the latest provisions of the Federal income tax and social security tax laws. For the spendable average weekly earnings formulas for the years 1979–81, see *Employment and Earnings,* November 1981, pp. 7–8. Real earnings data are adjusted using the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W).

NOTE: The industry divisions of mining; construction; tobacco manufactures (a major manufacturing group, nondurable goods); transportation and public utilities; and finance, insurance, and real estate are no longer shown. This is because the seasonal component in these is small relative to the trend-cycle, or irregular components, or both, and consequently cannot be precisely separated.

NOTE: The earnings expressed in 1977 dollars have been adjusted for changes in price level as measured by the Bureau's Consumer Price Index for Urban Wage Earners and Clerical Workers. These series are described in "The Spendable Earnings Series: A Technical Note on its Calculation," *Employment and Earnings* and *Monthly Report on the Labor Force*, February 1969, pp. 6-13. See also "Spendable Earnings Formulas, 1979-81," *Employment and Earnings*, November 1981, pp. 7-8.

NOTICE: After release of final December 1981 data in the April issue, the Bureau of Labor Statistics will discontinue computation and publication of the spendable earnings data. The real earnings series published here will appear with the data in the preceding table.

UNEMPLOYMENT INSURANCE DATA

NATIONAL UNEMPLOYMENT INSURANCE DATA are compiled monthly by the Employment and Training Administration of the U.S. Department of Labor from monthly records of unemployment insurance activity prepared by State agencies. Railroad unemployment insurance data are prepared by the U.S. Railroad Retirement Board.

Definitions

Data for **all programs** represent an unduplicated count of insured unemployment under State programs, Unemployment Compensation for Ex-Servicemen, and Unemployment Compensation for Federal Employees, and the Railroad Insurance Act.

Under both State and Federal unemployment insurance programs for civilian employees, insured workers must report the completion of at least 1 week of unemployment before they are defined as unemployed. Persons not covered by unemployment insurance (about 10 percent of the labor force) and those who have exhausted or not yet earned benefit rights are excluded from the scope of the survey. **Initial claims** are notices filed by persons in unemployment insurance programs to indicate they are out of work and wish to begin receiving compensation. A claimant who continued to be unemployed a full week is then counted in the insured unemployment figure. The **rate of insured unemployment** expresses the number of insured unemployed as a percent of the average insured employment in a 12-month period.

An **application** for benefits is filed by a railroad worker at the beginning of his first period of unemployment in a benefit year; no application is required for subsequent periods in the same year. **Number of payments** are payments made in 14-day registration periods. The **average amount of benefit payment** is an average for all compensable periods, not adjusted for recovery of overpayments or settlement of underpayments. However, **total benefits paid** have been adjusted.

21. Unemployment insurance and employment service operations

[All items except average benefits amounts are in thousands]

Item	1980	1981											
	Dec.	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.[p]

[1] Initial claims and State insured unemployment include data under the program for Puerto Rican sugarcane workers.

[2] Includes interstate claims for the Virgin Islands. Excludes transition claims under State programs.

[3] Excludes data on claims and payments made jointly with other programs.

[4] Includes the Virgin Islands. Excludes data on claims and payments made jointly with State programs.

[5] Cumulative total for fiscal year (October 1-September 30). Data computed quarterly.

NOTE: Data for Puerto Rico included. Dashes indicate data not available.

PRICE DATA

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Definitions

The **Consumer Price Index** is a monthly statistical measure of the average change in prices in a fixed market basket of goods and services. Effective with the January 1978 index, the Bureau of Labor Statistics began publishing CPI's for two groups of the population. One index, a new CPI for All Urban Consumers, covers 80 percent of the total noninstitutional population; and the other index, a revised CPI for Urban Wage Earners and Clerical Workers, covers about half the new index population. The All Urban Consumers index includes, in addition to wage earners and clerical workers, professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctor's and dentist's fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. Prices are collected from over 18,000 tenants, 24,000 retail establishments, and 18,000 housing units for property taxes in 85 urban areas across the country. All taxes directly associated with the purchase and use of items are included in the index. Because the CPI's are based on the expenditures of two population groups in 1972–73, they may not accurately reflect the experience of individual families and single persons with different buying habits.

Though the CPI is often called the "Cost-of-Living Index," it measures only price change, which is just one of several important factors affecting living costs. Area indexes do not measure differences in the level of prices among cities. They only measure the average change in prices for each area since the base period.

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes contains about 2,800 commodities and about 10,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (that is, finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings.

Price indexes for the output of selected SIC industries measure average price changes in commodities produced by particular industries, as defined in the *Standard Industrial Classification Manual 1972* (Washington, U.S. Office of Management and Budget, 1972). These indexes are derived from several price series, combined to match the economic activity of the specified industry and weighted by the value of shipments in the industry. They use data from comprehensive industrial censuses conducted by the U.S. Bureau of the Census and the U.S. Department of Agriculture.

Notes on the data

Beginning with the May 1978 issue of the *Review*, regional CPI's cross classified by population size, were introduced. These indexes will enable users in local areas for which an index is not published to get a better approximation of the CPI for their area by using the appropriate population size class measure for their region. The cross-classified indexes will be published bimonthly. (See table 24.)

For further details about the new and the revised indexes and a comparison of various aspects of these indexes with the old unrevised CPI, see *Facts About the Revised Consumer Price Index*, a pamphlet in the Consumer Price Index Revision 1978 series. See also *The Consumer Price Index: Concepts and Content Over the Years*, Report 517, revised edition (Bureau of Labor Statistics, May 1978).

For interarea comparisons of living costs at three hypothetical standards of living, see the family budget data published in the *Handbook of Labor Statistics, 1977*, Bulletin 1966 (Bureau of Labor Statistics, 1977), tables 122–133. Additional data and analysis on price changes are provided in the *CPI Detailed Report* and *Producer Prices and Price Indexes*, both monthly publications of the Bureau.

As of January 1976, the Wholesale Price Index (as it was then called) incorporated a revised weighting structure reflecting 1972 values of shipments. From January 1967 through December 1975, 1963 values of shipments were used as weights.

For a discussion of the general method of computing consumer, producer, and industry price indexes, see *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), chapters 13–15. See also John F. Early, "Improving the measurement of producer price change," *Monthly Labor Review*, April 1978, pp. 7–15. For industry prices, see also Bennett R. Moss, "Industry and Sector Price Indexes," *Monthly Labor Review*, August 1965, pp. 974–82.

[1] Data for September 1981 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[2] Not available.

[3] Prices for natural gas are lagged 1 month.

[4] Includes only domestic production.

[5] Most prices for refined petroleum products are lagged 1 month.

[6] Some prices for industrial chemicals are lagged 1 month.

r = revised.

[1] Data for September 1981 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

r=revised.

PRODUCTIVITY DATA

Productivity data are compiled by the Bureau of Labor Statistics from establishment data and from estimates of compensation and output supplied by the U.S. Department of Commerce and the Federal Reserve Board.

Definitions

Output is the constant dollar gross domestic product produced in a given period. Indexes of **output per hour of labor input,** or labor productivity, measure the value of goods and services produced per hour of labor. **Compensation per hour** includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. The data also include an estimate of wages, salaries, and supplementary payments for the self-employed, except for nonfinancial corporations, in which there are no self-employed. **Real compensation per hour** is compensation per hour adjusted by the Consumer Price Index for All Urban Consumers.

Unit labor cost measures the labor compensation cost required to produce one unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current dollar gross domestic product and dividing by output. In these tables, **unit nonlabor costs** contain all the components of unit nonlabor payments except unit profits. **Unit profits** include corporate profits and inventory valuation adjustments per unit of output.

The **implicit price deflator** is derived by dividing the current dollar estimate of gross product by the constant dollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

The use of the term "man hours" to identify the labor component of productivity and costs, in tables 31 through 34, has been discontinued. **Hours of all persons** is now used to describe the labor input of payroll workers, self-employed persons, and unpaid family workers. **Output per all-employee hour** is now used to describe labor productivity in nonfinancial corporations where there are no self-employed.

Notes on the data

In the private business sector and the nonfarm business sector, the basis for the output measure employed in the computation of output per hour is Gross Domestic Product rather than Gross National Product. Computation of hours includes estimates of nonfarm and farm proprietor hours.

Output data are supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics.

Beginning with the September 1976 issue of the *Review,* tables 31–34 were revised to reflect changeover to the new series—private business sector and nonfarm business sector—which differ from the previously published total private economy and nonfarm sector in that output imputed for owner-occupied dwellings and the household and institutions sectors, as well as the statistical discrepancy, are omitted. For a detailed explanation, see J. R. Norsworthy and L. J. Fulco, "New sector definitions for productivity series," *Monthly Labor Review,* October 1976, pages 40–42.

LABOR-MANAGEMENT DATA

MAJOR COLLECTIVE BARGAINING DATA are obtained from contracts on file at the Bureau of Labor Statistics, direct contact with the parties, and from secondary sources. Additional detail is published in *Current Wage Developments*, a monthly periodical of the Bureau. Data on work stoppages are based on confidential responses to questionnaires mailed by the Bureau of Labor Statistics to parties involved in work stoppages. Stoppages initially come to the attention of the Bureau from reports of Federal and State mediation agencies, newspapers, and union and industry publications.

Definitions

Data on wage changes apply to private nonfarm industry agreements covering 1,000 workers or more. Data on wage and benefit changes *combined* apply only to those agreements covering 5,000 workers or more. **First-year wage settlements** refer to pay changes going into effect within the first 12 months after the effective date of the agreement. **Changes over the life of the agreement** refer to total agreed-upon settlements (exclusive of potential cost-of-living escalator adjustments) expressed at an average annual rate. **Wage-rate changes** are expressed as a percent of straight-time hourly earnings, while **wage and benefit changes** are expressed as a percent of total compensation.

Effective wage-rate adjustments in major bargaining units measure actual changes during the reference period, whether the result of a newly negotiated increase, a deferred increase negotiated in an earlier year, or a cost-of-living adjustment. Average adjustments are affected by workers receiving no adjustment, as well as by those receiving increases or decreases.

Work stoppages include all known strikes or lockouts involving six workers or more and lasting a full shift or longer. Data cover all workers idle one shift or more in establishments directly involved in a stoppage. They do not measure the indirect or secondary effect on other establishments whose employees are idle owing to material or service shortages.

35. Wage and benefit settlements in major collective bargaining units, 1976 to date

[In percent]

How to order BLS publications

PERIODICALS

Order from (and make checks payable to) Superintendent of Documents, Washington, D.C. 20402. For foreign subscriptions, add 25 percent.

Monthly Labor Review. The oldest and most authoritative government research journal in economics and the social sciences. Current statistics, analysis, developments in industrial relations, court decisions, book reviews. $23 a year, single copy $3.50.

Employment and Earnings. A comprehensive monthly report on employment, hours, earnings, and labor turnover by industry, area, occupation, et cetera. $31 a year, single copy $3.75.

Occupational Outlook Quarterly. A popular periodical designed to help high school students and guidance counselors assess career opportunities. $8 for four issues, single copy $2.75.

Current Wage Developments. A monthly report about collective bargaining settlements and unilateral management decisions about wages and benefits; statistical summaries. $14 a year, single copy $2.50.

Producer Prices and Price Indexes. A comprehensive monthly report on price movements of both farm and industrial commodities, by industry and stage of processing. $20 a year, single copy $3.25.

CPI Detailed Report. A monthly periodical featuring detailed data and charts on the Consumer Price Index. $20 a year, single copy $3.50.

PRESS RELEASES

The Bureau's statistical series are made available to news media through press releases issued in Washington. Many of the releases also are available to the public upon request. Write: Bureau of Labor Statistics, Washington, D.C. 20212.

Regional. Each of the Bureau's eight regional offices publishes reports and press releases dealing with regional data. Single copies available free from the issuing regional office.

BULLETINS AND HANDBOOKS

About 140 bulletins and handbooks published each year are for sale by regional offices of the Bureau of Labor Statistics (see inside front cover) and by the Superintendent of Documents, Washington, D.C. 20402. Orders can be charged to a deposit account number or checks can be made payable to the Superintendent of Documents. Visa and MasterCard are also accepted; include card number and expiration date. Among the bulletins and handbooks currently in print:

Occupational Outlook Handbook, 1980–81 Edition. Bulletin 2075. A useful resource supplying valuable assistance to all persons seeking satisfying and productive employment. $9, paperback; $12, cloth cover.

Employment Trends in Computer Occupations. Bulletin 2101, October 1981. Results of a BLS study of employment of workers in five computer-related occupations. $3.50.

National Survey of Professional, Administrative, Technical, and Clerical Pay, March 1981. Bulletin 2108. Summarizes the results of the Bureau's annual salary survey for 23 occupations. Data for purchasing assistants and photographers published for the first time. $4.75.

Occupational Projections and Training Data. Bulletin 2052. Presents both general and detailed information on the relationship between occupational requirements and training needs. (Updates Bulletin 2020.) $5.50.

Exploring Careers. Bulletin 2001. A new career guidance resource designed for junior high school students but useful for older students as well. Includes occupational narratives, evaluative questions, suggested activities, career games, and photographs. $11.

Industry Wage Survey: Life Insurance, February 1980. Bulletin 2119. A summary of the results of a survey of occupational wages and employee benefits in home and regional offices of life insurance carriers in February 1980. $3.25.

Major Collective Bargaining Agreements: Plant Movement, Interplant Transfer, and Relocation Allowances. Bulletin 1425–20. Information regarding three important issues in collective bargaining. $5.50.

Perspectives on Working Women: A Databook. Bulletin 2080. Presents comprehensive statistics on characteristics of working women. Topics covered in 100 tables and brief text include extent of work experience, marital and family status, education, earnings, occupations, and race and Hispanic ethnicity. (Updates Bulletin 1977.) $5.00.

Youth Unemployment: An International Perspective. Bulletin 2098. An examination of the labor market experience of youth in the United States and eight other industrial countries from the early 1960's to the late 1970's. $3.50.

MONTHLY LABOR REVIEW

MAY 1982
VOLUME 105, NUMBER 5

Henry Lowenstern, Editor-in-Chief
Robert W. Fisher, Executive Editor

TRENDS IN COMPENSATION

Arthur Sackley 3 **Wage increases moderate in 1981**
Most wage series rose more slowly, especially in the fourth quarter,
but when adjusted for inflation, wages declined; the wage-price gap narrowed

Beth Levin 9 **The Employment Cost Index: recent trends and expansion**
The 9.8-percent compensation rise in 1981 matched the 1980 increase;
ECI coverage extended to employees of State and local governments

Norma W. Carlson 15 **Time rates tighten their grip on manufacturing industries**
Incentive pay plans continued to lose popularity in 37 industries,
according to a study that compared incidence for 1973–80 and 1961–68

M. E. Personick, C. B. Barsky 23 **White-collar pay levels linked to corporate work force size**
Larger-size firms generally pay high salaries for white-collar workers;
but the pay advantage varies by occupation and skill level

Labor Month In Review

NEW TECHNOLOGY. The Bureau of Labor Statistics continued its studies of technological change by appraising the impact of new technology on productivity and occupations in four major industries. The studies show—

Meat products. Most of the new technology occurred in the 1960's and include rail systems for moving animal carcasses between cutting stations, eliminating the constant repositioning required in the previous method. Also, for beef processing, workers were equipped with power knives and saws for carcass splitting, mechanical hide pullers eliminated the hand cutting operations necessary for hide removal, and rendering operations were mechanized so that one worker became responsible for the entire process. In the poultry processing industry, innovations included mechanized slaughtering, feather removal, and packaging and conveyors and rail systems to move carcasses through the plant. A large proportion of meat and poultry cutting operations is still done manually. Automation is hindered by the difficulty of developing an economical and reliable cutting machine capable of adapting to the physical differences in animal carcasses.

Not much change is expected in job content and skill requirements in the 1980's. In 1978, 3 of 5 meat products workers were operatives—meatcutters, packers, or machine operators; they are expected to account for two-thirds of the industry's work force by 1990.

Foundries. The specific technologies gaining prominence include improved material handling devices, automatic equipment for molding and coremaking, more productive diecasting technology, more widespread use of electric furnaces in melting and mechanized systems in pouring operations, advances in cleaning and finishing equipment, and more extensive instrumentation and computerization. The industry also has invested substantial funds for technology to reduce pollution and improve worker health and safety.

The trend to mechanization will continue to alter the structure of occupations. Foundries are employing proportionally more engineers, technicians, and maintenance workers in response to more extensive and complex production equipment. Hence, production workers have declined relative to the total foundry work force and the composition of occupations in this category is changing. A further decline is expected in occupations which involve large manual tasks. The more widespread use of improved trucks, hoists, conveyors, and related equipment will reduce the need for hand laborers, but will increase the need for truck operators. More maintenance mechanics and repairers will be needed to service the complex equipment. Robots may assume some job functions.

Metalworking machinery. Numerical control of machine tools is the most significant new technology introduced in this industry in the past 25 years. It involves the automatic control of a machine tool's movement by an electronic controller or computer which reads instructions in digital form. Numerically controlled tools reduce setup time and eliminate the need for costly tooling devices, and can produce parts with greater precision and uniformity. Despite these advantages, most machine tool shops still rely on skilled workers using conventional tools.

Operatives and craftworkers, the two largest blue-collar occupations, accounted for one-third of the industry's employment in 1978. Operatives are expected to grow by 36 percent by 1990, while craftworkers' growth will be about half that rate. Thus, operatives will account for a somewhat larger percent of total employment in 1990 than in 1978, while craftworkers' share will decline slightly.

The costliness of numerically controlled machines and the intricacy of their control systems will create a demand for preventive maintenance mechanics trained in electronics. Employment of these mechanics, repairers, and installers (a subdivision of the craftworker group) will expand five times as fast as all craft employment. The professional and technical worker group will grow by 22 percent by 1990. Engineers will remain the dominant occupation for this group, with about half of them still in the mechanical field.

Electrical and electronic equipment. New technology includes equipment to design and fabricate semiconductors and related devices, increased automation in assembly line operations, numerically controlled machine tools, and advanced production equipment.

More than one-half of the industry's work force were engaged in manufacturing communication equipment and electronic components. The structure of occupations is expected to change. All occupational groups, except salesworkers, are expected to increase in the 1980's. Operatives, the largest group, will increase by more than one-fourth, and will continue to be the largest group, at 47 percent of total employment. Assemblers make up more than one-third of the operatives; they are expected to increase at a slightly higher rate than the average for all occupations in the industry.

Technologies applicable to assembly operations will be diffused more widely, but assembly of household appliances and other products will continue to involve a high degree of manual tasks.

The four studies have been published in BLS Bulletin 2104, *Technology and Labor in Four Industries*, which is available from the Superintendent of Documents, Government Printing Office, Washington, D.C. 20402. Price: $3.25. □

Wage increases moderate in 1981

Most wage series rose more slowly, with much of the slowdown in the fourth quarter; when adjusted for inflation, they showed declines, although the wage-price gap was narrower

ARTHUR SACKLEY

Wage gains were moderate in 1981, as the recession developed and inflation abated. Nearly all of the Bureau of Labor Statistics' measures of wage change recorded smaller advances than in the previous year.[1] When adjusted for inflation, most measures of real wages declined (continuing the trend started in 1979), but at a diminishing rate, mainly because of the slowdown in the rise in consumer prices. The impact of the recession was especially evident in the Bureau's cyclically sensitive average weekly earnings series; it showed the lowest rate of increase in more than a decade. In fact, the only measure that did not rise more slowly than in the previous year was new settlements negotiated during the year in large bargaining units.

The downturn in economic activity and the easing of inflation, a relatively light incidence of collective bargaining, and wage decisions in prior years were among the elements influencing wage changes in 1981. An examination of the role of these factors is helpful in understanding wage developments in the overall economy and in the collective bargaining sector.

The state of the economy was a major influence on wage changes in 1981. After rising vigorously at an annual rate of 8.6 percent in the first quarter, real gross national product leveled off, then fell 4.7 percent in the fourth quarter. Economic indicators relevant to wage changes reflected this shift: from July to December employment dropped by 1.3 million, unemployment rose by 1.8 million, the unemployment rate climbed from 7.2 to 8.8 percent, and both the factory workweek and overtime hours declined markedly.

Cyclical downturns initially tend to depress workers' earnings, as employers cut back on hours of work. Then, as the recession deepens, hiring is restricted and layoffs spread, producing increasing slack in labor markets which, in turn, dampens the pressure for pay increases.

The 1981 recession contributed to some abatement in the upward pressure prices may have exerted on wages in recent years. The Consumer Price Index for All Urban Consumers (CPI-U) rose 8.9 percent in 1981—the smallest increase in 4 years.

The government sector was under some of the same pressure as private industry. Because government services are highly labor intensive, public payrolls were especially vulnerable to the fiscal restraints experienced at all levels of government in 1981. However, available data indicate that most of the labor cost containment measures have affected employment more than wages.

In the organized sector of the economy, activity was comparatively subdued, despite the substantial changes in the economic climate and wage and price movements. It was a very light year for bargaining, and the incidence of work stoppages declined to its lowest level since 1940.

Arthur Sackley is an economist in the Office of Prices and Living Conditions, formerly with the Office of Wages and Industrial Relations, Bureau of Labor Statistics.

Wage and compensation changes

Nearly all measures of wage and compensation change registered smaller advances in 1981 than in the previous year, with much of the deceleration occurring in the fourth quarter. The measures also show a smaller percentage rise in wages than in the Consumer Price Index, resulting in further erosion in purchasing power for most workers, although the gap between price and wage increases was narrower than in recent years. Table 1 shows trend data in current and 1977 dollars for several key compensation series.

Hourly compensation is the measure with the broadest scope. It includes payrolls and employer contributions to social insurance and private benefit plans. Hourly compensation in the private nonfarm business sector went up 9.3 percent in 1981. Although this was the third largest increase in the series in the last decade, it was less than that of 1980, and was the first year-to-year decline in the rate of increase since 1977. Hourly compensation data not only measure trends in wages and benefits, but also the labor cost component in unit labor costs, a key indicator of inflationary trends. Typically, at the onset of a recession, output declines faster than employment and hours of work. Consequently, productivity (output per employee hour) falls, as was the case in the second half of 1981. The fourth-quarter decline in productivity was the largest since the productivity series began in 1947. The magnitude of this drop was reflected in a steep climb in unit labor costs (hourly compensation divided by output per employee hour) as the recession deepened, despite a slower rise in hourly compensation.

The average hourly and weekly earnings series are more restricted in scope than hourly compensation. They cover only wages and salaries of production and nonsupervisory workers in the private nonfarm economy. These measures typically decline or slow their rate of increase in the initial phase of a downturn through the effects of a shift in the employment mix caused by layoffs in cyclically sensitive high-wage industries, less overtime, and, for weekly earnings, shorter workweeks. This was the pattern in 1981.

Average hourly earnings rose 7.2 percent in 1981, the smallest increase since 1977. Some of the slowdown is attributable to recession-related layoffs in construction and durable goods manufacturing, both relatively high-paying sectors. The shift away from these high-wage industries depressed average earnings. Average weekly earnings, reflecting the slower rise in hourly earnings and a reduction in the workweek during the second half of the year, went up by only 6.0 percent in 1981—the smallest gain since the 1960's.

Wage measures that are not influenced by changes in the workweek and shifts in the distribution of employment by industry are less sensitive to cyclical fluctuations in economic activity. The Hourly Earnings Index minimizes these shift effects, by excluding overtime in manufacturing industries and by applying fixed-weighted aggregate employee hours to average earnings at a detailed industry level. It provides data for broad industry groups and the private nonfarm economy. The Hourly Earnings Index went up 8.2 percent in 1981, a smaller increase than the 9.4-percent rise of the previous year, but the deceleration was not as pronounced as that for average hourly or weekly earnings.

The Employment Cost Index is broader in occupational and industrial coverage than the Hourly Earnings Index, and measures compensation as well as wages.[2] It more closely approximates underlying wage rate trends

Table 1. Changes in employee wages and compensation, 1971–81
[In percent]

[1] Covers all employees in the nonfarm business sector.
[2] Covers production and nonsupervisory workers in the private nonfarm economy.
[3] Covers only wages and salaries in the private nonfarm economy, excluding households. Data are unavailable before 1976.

NOTE: Percent changes are based on seasonally adjusted data and reflect fourth quarter to fourth quarter change for average hourly compensation and December to December change for other measures.

because it controls for both occupational and industry employment shifts, and excludes all overtime pay and hours, not only those in manufacturing firms. Furthermore, it measures changes in benefit cost resulting from changes in benefit practices rather than temporary shifts in benefit usage or other transient influences. Because of these and other features, this index is less sensitive than the other measures to short-term economic fluctuations. The 1981 Employment Cost Index shows a relatively smaller change from the previous year than the other measures. The wage and salary series went up 8.8 percent in 1981, compared with 9.0 percent in 1980. Compensation (wages and benefits), as measured by this index, went up 9.8 percent in both years.

All measures of wage change that have been discussed here showed slower gains toward the end of 1981 than during the early part of the year. The annual rates of change in the 6 months ending in December were 6.2 percent for the average hourly earnings, 4.4 percent for weekly earnings, and 7.3 percent for the Hourly Earnings Index. Average hourly compensation rose at a 6.5-percent annual rate in the fourth quarter. After a large advance in the first quarter, both the compensation and wage series of the Employment Cost Index registered smaller gains during the remainder of 1981.

Even though the rate of growth in the Consumer Price Index slowed more than the pace of most measures of wages, it still exceeded the rate of pay gains. As a result, the gap between price and wage increases narrowed, but erosion in workers' purchasing power continued. Real gross average weekly earnings, a widely used indicator of the impact of price increases on pay, fell 2.5 percent in 1981.

Government compensation

All the BLS compensation data discussed to this point cover only the private sector. The Employment Cost Index, however, has recently been expanded to include data for State and local governments, but results for a full year are not yet available for annual comparisons. Data on government workers from other sources suggest that the initial impact of fiscal restraints in 1981 was on employment rather than pay gains. For the first time since the immediate post-World War II period, aggregate employment fell, as layoffs and hiring freezes were imposed. During most of 1981, salaries of 1.4 million Federal white-collar employees under the General Schedule pay system were 9.1 percent higher than during the same period a year earlier, mostly a result of a pay raise in October 1980. Their annual pay raise in October 1981 was limited to 4.8 percent, the smallest increase since the passage of the Federal Pay Comparability Act of 1970. Under special legislation and presidential order, about 450,000 blue-collar Federal employees also were held to a 4.8-percent pay increase. Limited data for State and local employees indicate that their pay gains were mainly the result of decisions in prior years, and that 1981 wage decisions were less generous.

Collective bargaining

The major collective bargaining wage-and-benefit change statistics are more limited in scope than the earnings-and-compensation change series because the data are restricted to bargaining units of at least 1,000 workers in the private economy, and at least 5,000 in State and local governments.[3] Although such bargaining units employ less than 10 percent of the labor force, wage decisions affecting them influence wage developments in the overall economy. And negotiated wage decisions affecting them may set patterns for wage decisions in smaller bargaining situations and in nonunion establishments or political jurisdictions.

The major collective bargaining series provide two basic types of information for assessing wage developments—data on negotiated wage-and-benefit settlements and data on effective wage rate adjustments. Settlement data are forward looking and relate to changes in wages and compensation provided for in contracts reached during a period. They are expressed as changes during the first year and average annual changes over the life of the contract. Effective wage rate adjustments include those changes resulting from agreements negotiated during the period, deferred wage changes resulting from settlements reached in prior periods, and increases triggered by cost-of-living adjustments (COLA) clauses. Of the two types of data, effective wage adjustments are more comparable to the earnings and compensation change measures discussed earlier.

Effective wage adjustments in major collective bargaining units in private industry average 9.5 percent in 1981, down from 9.9 percent in the previous year, paralleling the deceleration in the rate of increase of more comprehensive earnings and compensation series. (See table 2.) A light bargaining year appears to have been an important factor in the smaller increase. Deferred increases are generally lower, on average, than first-year changes under new settlements. In the light bargaining year of 1981, more workers were covered by deferred increases than by new settlements, holding down the size of the overall adjustment.

In 1981, approximately 6.3 million workers received deferred increases averaging 5.3 percent. When prorated over all workers, the increase was 3.8 percent. New settlements provided adjustments of 9.8 percent, but covered only 2.2 million workers, resulting in an adjustment of just 2.5 percent for all workers. The average COLA increase for the 4.6 million covered workers in 1981 was 6.1 percent (approximately three-fourths of the rise in the CPI over the period of COLA review), or

3.2 percent averaged over all workers.

Data on settlements negotiated during the year are useful as indicators of the size of future wage changes. In 1981, negotiated settlements provided wage adjustments averaging 9.8 percent in the first year of the contract, and 7.9 percent annually over the life of the contract. These are the largest annual increases since 1975, another recession year. Increases in wages and benefits, calculated for settlements covering 5,000 workers or more, were 11.3 percent for the first year, and 8.4 percent over the life of the contract.

The higher wage adjustments reflected in settlement data are not necessarily inconsistent with the 1981 economic environment if other factors are taken into account. The multi-year nature of most contracts tends to reduce the impact of prevailing economic conditions on the amount of wages provided for in current settlements. Current settlements may be influenced by precedent-setting agreements reached earlier in other bargaining situations under quite different economic circumstances, and may also reflect what has occurred in the interim between the previous settlement and current negotiations. For example, a steep rise in consumer prices since the previous contract, not compensated by COLA's, may create pressures for catch-up increases, even though inflation may have abated in the meantime. This may have been the situation in 1981. When the same parties to 1981 settlements last negotiated (on average, about 30 months before), the average wage adjustment was 8.6 percent in the first year, and 7.0 percent annually over the life of the contract. Over a comparable span from mid-1978 to mid-1981, the CPI rose at an annual rate of nearly 12 percent. Although some of the gap between negotiated wage increases and this price rise was offset by COLA's, most workers experienced an erosion in the purchasing power of their pay.

Expectations concerning future inflation and other related economic factors are also important considerations which may dilute the impact of current economic conditions on multi-year contracts. Concern about the rate of inflation may have influenced bargaining. In 1981, the rate of price increase did not dip below the double-digit level until most of the year's negotiations had been concluded. Contracts with COLA's provided for adjustments of 8.0 percent the first year and 5.5 percent annually over the contract life; for contracts without COLA, the comparable adjustments were 10.6 and 8.8 percent.

Wage decisions may also be less sensitive to prevailing economic conditions than to pressures to maintain existing pay relationships among groups of workers and industries. Management and labor tend to prefer employment and hours adjustments to marked changes in compensation which may upset longstanding wage relationships.

The influence of 1981 settlements was tempered by the relatively small number of workers they covered. Agreements reached during the year covered only 2.4 million workers, compared with 3.8 million in 1980. Another consideration is that settlements in the construction industry, which make up a higher proportion of total settlements in light than in heavy bargaining years, were a major factor in boosting the overall average adjustment. Settlements in this industry accounted for nearly 1 in 4 workers covered by major agreements concluded in 1981. When construction settlements are excluded from the data, first-year contract changes averaged 8.6 percent, and adjustments over the life of the contract, 6.7 percent.

Several mitigating circumstances should be taken into account in assessing the sizable wage gains of construction settlements against the general economic slowdown and depressed activity in the industry. One consider-

Current settlement	3.1	3.3
Prior settlement	3.0	4.5
Cost-of-living adjustment provision	.4	.9

ation is the concentration of construction settlements in the spring, when economic activity was considerably more robust than in subsequent months. Another is that major bargaining situations are concentrated in heavy and commercial construction, which generally has not shared in the slump experienced by the less organized residential segment of the industry.

Collective bargaining data for State and local government workers show the influence of past wage decisions. When prorated over the approximately 1 million workers in large bargaining units, the average effective wage adjustment was 8.7 percent in 1981, compared with 6.5 percent the previous year. (See table 3.) However, the major factor in the higher 1981 adjustment was the larger component of the total adjustment attributable to settlements negotiated in prior years. For settlements reached in 1981, the data are more consistent with what might be expected in light of the fiscal pressures on public officials to limit pay adjustments. On balance, 1981 settlements provided smaller adjustments than those negotiated in the previous year.

Although overall, both private industry and State and local government settlements were relatively large in 1981, there were wage-and-benefit concessions by workers in several key industries experiencing economic difficulties. Wage or benefit concession, or both, were negotiated for 95,000 workers in the automobile, airlines, and meatpacking industries. About 67,000 other workers were covered by agreements negotiated in 1981 that provided for no wage change in the first contract year. Similarly, a settlement for city workers in Detroit provided for a compensation freeze.

Outlook for 1982

Nearly all of the economic conditions affecting wage developments in 1981, such as declines in aggregate output, high levels of unemployment, and the moderating rate of inflation, persisted in the first few months of 1982. If they persist through most of the year, they may temper pressure for wage gains.

Historically, when economic declines have leveled off and economic activity has picked up, some factors influencing wage changes in recessions have operated in reverse. Additions to the workweek, more overtime, and rehiring in the durable goods and construction industries have tended to push up average earnings at a brisk pace. If the pattern of prior recoveries is repeated, output would go up faster than employment and hours, resulting in an increase in productivity, and a modest rise in unit labor cost.

Negotiations in several key industries highlight this heavy bargaining year.[4] About 3.6 million workers are covered by major agreements expiring or reopening in 1982, compared with only 2.6 million in 1981. Agreements have already been reached in the automobile, petroleum refining, meatpacking, and trucking industries; negotiations are underway in the rubber industry; and bargaining is scheduled later for the electrical machinery and equipment industry. These six industries cover 1.2 million workers, and another 500,000 construction workers are covered by agreements which are expiring or reopening this year, mostly in the spring.

In several completed contract negotiations, the outcomes appear to have been influenced by economic problems facing individual industries. These problems included substantial excess capacity and falling oil prices for petroleum refiners; severe competitive pressures on carriers in the wake of deregulation of interstate trucking; long-term technological changes in the meatpacking industry and declining profitability which forced the closing of many less efficient, obsolete plants; and mounting losses in the automobile industry, a consequence of the severe slump in car sales and foreign competition. At the time of negotiations, workers in these industries were facing employment cutbacks. Therefore, job security was a major issue on the bargaining agenda.

The key contract in petroleum refining provided for a smaller wage increase than the union had proposed. In trucking, the major agreement included a wage freeze; in meatpacking, the pattern-setting agreement provided for a number of wage-and-benefit concessions and a moratorium on plant closings until mid-1983; the United Automobile Workers made substantial labor cost concessions to both Ford and General Motors in exchange for job security guaranties. Do these settlements portend a general moderating of pressure for wage gains in favor of greater job security, or do they merely reflect individual industry circumstances? This question awaits further developments for resolution.

In addition to wage changes resulting from settlements in 1982, about 4.3 million workers are scheduled to receive increases averaging 6.3 percent from contracts negotiated in prior years. This is the highest average deferred increase since 1971. Additionally, cost-of-living increases are scheduled for 3.4 million workers. Although the amount depends on the inflation rate and the formula used, a continuing abatement in price increases would dampen the size of these adjustments.[5]

In the public sector, budgetary constraints at all levels can be expected to hold down wage gains. President Reagan's 1983 budget submission projects a 5-percent pay raise for Federal white- and blue-collar workers in 1982, essentially the same amount as in 1981. One element in wage developments in 1981 will not be present in 1982: for the first time since 1973, no increase is scheduled in the Federal minimum wage. □

[5] Wage increases and COLA's scheduled in 1982 are analyzed in Douglas R. LeRoy, "Scheduled wage increases and cost-of-living provisions in 1982," *Monthly Labor Review*, January 1982, pp. 16–20.

The 'mandatory' agenda

In brief, there are today many 'mandatory' subjects of bargaining with which the employer must deal in good faith. Such subjects include wages, hours of employment, health insurance, pensions, safety practices, the grievance procedure, procedures for discharge, layoff, recall and discipline, seniority, and subcontracting. Managers are not required to make concessions or agree to union proposals on any of these (or various other) subjects. They *are* obligated, however, to meet with the union at reasonable times and with the good-faith intention of reaching an agreement. On 'nonmandatory' or 'voluntary' subjects —those that are lawful but not easily related to 'wages, hours and other conditions of employment'—employers are not so obligated and are free to refuse to bargain about them.

The Employment Cost Index: recent trends and expansion

The 9.8-percent rise in compensation in 1981 matched the year-earlier level; coverage was extended to employees of State and local governments and index numbers for wages and compensation were published for the first time

BETH LEVIN

After nearly a decade of developmental work. the Bureau of Labor Statistics Employment Cost Index (ECI) today tracks labor cost trends for nearly 88 million workers in the civilian nonfarm economy. There were two noteworthy expansions of the series in 1981—the inclusion of State and local government workers and the introduction of index numbers.

Last year, increases in the Employment Cost Index for private nonfarm workers were nearly the same as in 1980. (See tables 1 and 2.) The compensation index was up 9.8 percent in both years, while the wage and salary index increase of 8.8 percent in 1981 was slightly below the 9.0-percent increase in 1980. In contrast, the Consumer Price Index for Urban Wage Earners and Clerical Workers rose 12.5 percent in 1980 compared with 8.7 percent in 1981. Consequently, real wages increased slightly in 1981, while they fell in 1980. The last year prior to 1981 in which real wages increased was 1977.

All of the ECI compensation series published set record high increases in the first quarter of 1981.[1] However, in the remaining quarters of the year, compensation gains were generally below the pace set in the same periods in 1980. Legislated increases in the minimum wage and in the social security tax rate and earnings ceiling pushed up the March gains. The social security changes accounted for 0.5 percentage point of the 3.6-percent rise in compensation for all private nonfarm workers during the first quarter.

Changes in social security and other legally required benefits often cause the first quarter compensation advance to be the largest of the year. However, in 1981 both the social security tax rate and earnings ceiling increases were higher than usual:

Year	Tax rate: Level (in percent)	Tax rate: Percent increase	Earnings ceiling: Level	Earnings ceiling: Percent increase
1978	6.05	3.4	$17,700	7.3
1979	6.13	1.3	$22,900	29.4
1980	6.13	—	$25,900	13.1
1981	6.65	8.5	$29,700	14.7
1982	6.70	.8	$32,400	9.1

While the overall wage and salary changes in 1981 were similar to those in 1980, the underlying patterns were quite different. Union and blue-collar workers' advances declined in 1981 relative to 1980, while white-collar and nonunion workers' accelerated over the same period.

One factor in the moderation of gains in the union sector was the relatively light bargaining year for major collective bargaining contracts (those covering 1,000 workers or more) in 1981. In addition, economic conditions led to wage concessions by unionized workers in

Beth Levin is an economist in the Division of Employment Cost Trends, Bureau of Labor Statistics.

the meatpacking, rubber, and automobile industries in manufacturing, and in airlines and the railroad and trucking industries in nonmanufacturing.[2]

Union workers' pay increases dropped from 10.9 percent in 1980 to 9.6 percent in 1981. Within the manufacturing sector, union wage gains fell to 8.9 percent in 1981 from 11.0 percent in 1980, and in nonmanufacturing, they declined from 10.8 percent in 1980 to 10.2 percent in 1981. (See table 3.)

The rate of compensation increase for blue-collar workers, which decelerated from 10.1 percent in 1980 to 9.6 percent in 1981, reflected the highly unionized composition of these occupations. Wage gains for blue-collar workers slowed even more than compensation gains, dropping from 9.6 percent in 1980 to 8.6 percent in 1981. This decline in overall blue-collar wage advances was noted in all series.

Manufacturing workers did not post the dampened compensation gains that blue-collar workers did. Their rate of compensation change was identical in 1980 and 1981, at 9.8 percent. However, the pace of manufacturing wage increases did decline noticeably in 1981 (8.7 percent) relative to 1980 (9.4 percent). The first quarter's movement accounts for the difference between the compensation and wage and salary gains over the year. While there was a record 3.5-percent jump in compensation, the gain in wages and salaries was a moderate 2.2 percent. During the same quarter a year earlier, the increases were both 2.8 percent.

Both the durable and nondurable goods industries showed a pattern of deceleration of pay advances over the year which was similar to that for manufacturing as a whole.

In contrast to the slowdown evident in highly unionized sectors of the economy, nonunion workers and white-collar workers posted greater gains during 1981 than in 1980. Wages for nonunion workers rose 8.5 percent in 1981 compared with 8.0 percent the prior year. White-collar workers posted 9.1-percent wage gains in 1981, up from 8.7 percent in 1980. Similarly, white-collar compensation increases were higher in 1981 (10.1 percent) than in 1980 (9.5 percent).

Many of the year-to-year differences occurred because of record increases in first-quarter 1981. In that quarter, nonunion wage gains were 3.3 percent, up from 2.5 percent in 1980. White-collar workers received increases of 3.1 percent compared with 2.4 percent in first-quarter 1980. Within the white-collar group, catch-up increases

NOTE: Dashes indicate data not available.

for managers and administrators in the first quarter, as well as the effect of an 8.1-percent rise in the minimum wage on sales and clerical workers, boosted the overall annual wage increase. While service workers also posted record gains for the first quarter, they showed little difference in gains over the entire year relative to 1980.

In nonmanufacturing, both compensation and wage advances were similar to those experienced in 1980. Compensation was up 9.7 percent in 1981 versus 9.8 percent in 1980, and the comparable wage increases were 9.0 percent and 8.8 percent, respectively. The component industries of nonmanufacturing, however, showed a variety of wage change patterns between the 2 years. Construction posted the same increase (8.8 percent) in both years, while finance, insurance, and real estate, and services—sectors with a high concentration of white-collar employees—showed a large acceleration of wage gains in 1981. Transportation and public utilities, and wholesale trade recorded sharp declines in the rate of increase from 1980 to 1981.

State and local governments

Compensation of State and local government workers rose 5.3 percent in its September introductory quarter, compared with a 2.0 percent rise for private nonfarm workers. The difference between the two series was also

The Employment Cost Index: a chronology

Development of a measure of change in total compensation (wages and benefit costs) began during the early 1970's when concerns about labor cost escalation became particularly acute. At that time, Federal policymakers indicated the need for a measure of labor cost trends which would:

- be timely and comprehensive, covering all types of workers and industries in the U.S. economy and all elements of employee compensation;
- be fixed-weighted so that it would be unaffected by employment shifts among occupations and industries with different wage and compensation levels; and
- have internally consistent subseries (for example, by occupation or industry) to provide insights into overall wage and compensation trends.

The Employment Cost Index was planned in stages to satisfy these needs, beginning with the development of its conceptual and statistical framework during 1971–74. The first publication of ECI statistics in June 1976 presented percent changes for 21 private nonfarm wage and salary series for the quarters ended December 1975 and March 1976. Series were added until trends for 35 private nonfarm wage and salary series were available for the first quarter of 1979. One year later, measures of changes in compensation (wages and salaries plus employer costs for employee benefits) were introduced for six private nonfarm series—total; white-collar, blue-collar, and service workers; and manufacturing and nonmanufacturing industries. Following the publication of the compensation series, the Office of Management and Budget designated the ECI as a "Principal Federal Economic Indicator." During the past year, the State and local government sector was added, and indexes were published for all series.

The Bureau publishes standard (fixed-base-period-employment weighted) ECI indexes (June 1981 = 100) of wages and salaries and of compensation for the civilian nonfarm economy and for a number of subgroups. In addition, special wage and salary indexes are calculated for broad regions, union status, and area size. The currently available ECI indexes and their inception dates are listed below.

ECI series

Indexes of compensation

Civilian nonfarm economy (8 series): total; white-collar, blue-collar, and service workers; manufacturing and nonmanufacturing industries, plus services and public administration. Beginning in *June 1981.*

Private nonfarm economy (6 series): total; white-collar, blue-collar, and service workers; manufacturing and nonmanufacturing industries. *December 1979.*

State and local government (8 series): total; white-collar and blue-collar workers; services, schools, elementary and secondary schools, hospitals and other services, and public administration. *June 1981.*

Indexes of wages and salaries

Civilian nonfarm economy (8 series): total; white-collar, blue-collar, and service workers; manufacturing and nonmanufacturing industries, plus services and public administration. *June 1981.*

Private nonfarm economy (23 series): total; white-collar (plus 4 subseries), blue-collar (plus 4 subseries), and service workers; manufacturing, durables, nondurables, and nonmanufacturing (plus 7 subseries) industries. *September 1975.* Exceptions: Durable manufacturing, nondurable manufacturing, and retail trade are available from *September 1976*; salesworkers from *March 1977*; wholesale trade from *June 1977*; and finance, insurance, and real estate from *December 1978.*

State and local government (8 series): total; white-collar and blue-collar workers; services, schools, elementary and secondary schools, hospitals and other services, and public administration. *June 1981.*

Special indexes of private nonfarm wages

Four regions of the Nation. *September 1975.*

Union and nonunion workers. *September 1975.*

Union and nonunion workers by manufacturing and nonmanufacturing sectors. *September 1976.*

Metropolitan and nonmetropolitan areas. *September 1975.*

Table 3. Employment Cost Index for wages and salaries of private nonfarm workers,[1] by bargaining status, region, and area size, December 1979–81

[Not seasonally adjusted]

Series	Indexes (June 1981 = 100)									Percent changes for		
	1979	1980				1981				12 months ended	3 months ended	12 months ended

[1] Excludes private household workers.

NOTE: The indexes for these series are not strictly comparable to those for the aggregate, occupational, and industry series. See G. Donald Wood, Jr., "Estimation procedures for the Employment Cost Index," pp. 40, in this issue.

dramatic for wages and salaries—5.0 percent compared with 2.0 percent. These differences can be explained by a concentration of wage and compensation changes for State and local government workers in the third quarter that does not occur in the private nonfarm sector.

One group that tends to receive annual increases during the September quarter is teachers. This is demonstrated by pay and compensation changes in schools, which rose 5.7 percent and 6.0 percent, respectively. Workers in elementary and secondary schools posted even larger gains in compensation (6.3 percent) and wages (6.0 percent).

The impact that teachers have in these gains is clear from the proportion of workers they represent within these industries. At the State and local level, they account for about one-fifth of total census employment. They make up roughly half of all workers in schools and about 60 percent of all workers in elementary and secondary schools.

Another concentration of pay and compensation increases in the third quarter is due to the timing of State and local jurisdictions' fiscal years. Many governments begin their fiscal year during the third quarter, and these jurisdictions frequently link compensation changes to the start of the fiscal year.

While these types of gains were not as large or as widespread as those for teachers, they were clearly greater than those in the private sector. For example, blue-collar State and local government workers posted an average compensation change of 4.2 percent, compared with only 2.2 percent for private nonfarm blue-collar workers.

The collection of wage and benefit data from establishments in State and local government is a major improvement of the ECI program. The addition of 13.3 million State and local government workers to the 74.5 million surveyed in the private nonfarm sector brings ECI coverage to nearly 88 million workers.[3] The ECI is the only source of quarterly measures of compensation change for all State and local government workers.

Initial data collection for the government units, begun in June 1980, was completed in January 1981; quarterly collection began in March 1981. The series was calculated and reviewed on a test basis for the March and June quarters. After all aspects had been assessed, the first percent changes, relating to the third quarter, were published. Statistics on civilian nonfarm workers (excluding Federal employees), which combine private nonfarm and State and local government data,[4] were also released at that time.

The method for measuring base-period cost and calculating quarterly change for establishments in State and local government is the same as that used for establishments in the private nonfarm sector. State and local government data are taken from 750 sample establishments. Data are collected for about five narrowly defined occupations in each sampled establishment. This results in a total of about 3,700 establishment-occupation observations. The specific jobs for which data are collected in each establishment are selected by the BLS representative who visits the establishment. The selection is based upon probability sampling and uses the establishment's job titles and employment. As in the private nonfarm sector, occupations are classified based on categories used in the 1970 census, while each government unit is designated in an industry according to a 1972 Standard Industrial Classification defined by the U.S. Office of Management and Budget.

Index numbers

The private nonfarm wage and salary index (June 1981 = 100) went from 64.0 in September 1975 to 103.8 in December 1981, an increase of 62.2 percent.[5] Most industry and occupation wage gains were closely clustered around the aggregate—white-collar workers, 59.4 percent; blue-collar workers, 66.2 percent; service workers, 61.7 percent; manufacturing workers, 65.3 percent; and nonmanufacturing workers, 60.7 percent.

The ECI industry and occupation indexes are standard Laspeyres indexes, similar to the Consumer Price Index in concept and form. The CPI compares what it would cost to purchase a fixed set of consumption items at current prices to what it would cost to purchase the same set of items at prices that existed in the reference period. The ECI compares what it would cost employers at current wages (or compensation costs) to hire a fixed set of labor inputs (employment in specific occupations in specific industries) to what it would have cost to hire the same set of labor inputs at reference-period wage or compensation levels.

Special wage and salary indexes are calculated for broad regions, and by union status and area size. The formula for these indexes cannot be expressed in a standard Laspeyres index number form, but they are a form of chain index. That is, each quarter the change in wages is estimated using a fixed set of employment weights based on that quarter's sample. The index is developed by taking the product of the quarterly relatives. Further explanation of ECI index techniques is given in the technical note on page 40 of this issue.

MUCH PROGRESS HAS BEEN MADE toward making the ECI the type of labor cost trend indicator it was designed to be. It is a comprehensive, fixed-weight measure with internally consistent subseries. Benefit costs in addition to wages are included, and worker coverage has been expanded to State and local governments. The introduction of standard Laspeyres indexes in December 1981 guarantees the fixed-weight nature of the industry and occupation subseries. In addition, the special indexes by bargaining status, region, and area size, while not fixed-base-period weighted, aid in analyzing wage and salary trends.

Long range objectives include introduction of additional compensation series, publication of benefit cost changes, and coverage of the Federal civilian work force.

FOOTNOTES

[1] Data are collected for the pay period including the 12th day of the last month of each quarter—March, June, September, and December.

[2] For further information on collective bargaining in 1981, see George Ruben, "Organized labor in 1981: a shifting of priorities," *Monthly Labor Review*, January 1982, pp. 21–28.

[3] In the base year of 1970, there were 9.8 million State and local government workers and 58.3 million private nonfarm workers.

[4] All ECI series exclude farm and private household workers.

[5] Percent changes for any period can be calculated by dividing the more recent quarter's index by the earlier index, subtracting 1 from the result, and then multiplying by 100. For example, the steps in the calculation of percent change for the private nonfarm compensation series from December 1980 to December 1981 are as follows:

$$1)\quad \frac{\text{December 1981 index} = 104.0}{\text{December 1980 index} = 94.7} = 1.098$$

$$2)\quad 1.098 - 1 = .098$$

$$3)\quad .098 \times 100 = 9.8 \text{ percent}$$

Time rates tighten their grip on manufacturing industries

Incentive pay plans continued to drop in popularity in 37 industries comparing incidence for the 1973–80 period with that for 1961–68; but alternative methods of motivating workers drew more attention from labor and management

NORMA W. CARLSON

Despite mounting concern in recent years over limited productivity gains in the Nation's manufacturing industries, interest in incentive pay systems seems to be declining as a way to stimulate worker output. A review of wage payment plans in manufacturing industries found that time rates continue to cover the great majority of production and related workers rather than losing their grip; time-rated systems are actually strengthening their hold in U.S. factories.

Emphasis on machine-paced manufacturing operations is a major reason for the limited incidence of incentive plans. As in earlier years, incentives tend to be concentrated in the restricted group of industries where workers can exert substantial influence on the rate of output. However, the widespread application of time rates does not mean that the impact of workers on production is being ignored. Various innovative programs, many independent of compensation systems, have emerged to address the issue of worker motivation.

This article examines recent trends in incentive and time-rated payments in manufacturing. It also explores factors that have influenced the movement toward time pay. Finally, the article highlights developments in the quality-of-worklife movement that seeks, among other goals, to motivate workers to higher performance on the job. Data were obtained from the Bureau of Labor Statistics' nationwide occupational wage surveys in selected manufacturing industries. These surveys collect information on occupational wage rates and the incidence of certain establishment practices, such as methods of wage payment, for about 50 manufacturing industries. Thirty-seven were selected for this study on the basis of available data for two 7-year periods, 1961–68 and 1973–80. The periods were defined over several years because the industries on the survey roster are studied every 3 to 5 years, not annually. The sample was also restricted to industries defined at the 4-digit level of detail in the Standard Industrial Classification Manual prepared by the U.S. Office of Management and Budget. Altogether for both periods examined, the 37-industry group represents about a quarter of the production and related workers in all manufacturing.[1] The span between observations for a single industry ranged from 10 years to 18; the average was 14 years.

Methods of wage payment

Workers are paid under a wide variety of incentive or time-rated plans.[2] Incentive plans, which establish a close link between output and earnings, are intended to fill a dual role, that is, to both stimulate worker efficiency and provide a system of employee compensation. In contrast, time-payment plans base earnings on a fixed hourly or weekly rate and rely heavily on supervi-

sory skills to maintain quantity and quality of work.

Early in the Nation's industrial era, the basic methods of pay were simple piece rates and day rates. But as the manufacturing sector grew and mechanization of production increased, compensation plans became more complex. The scientific management movement dating from the early 1900's sparked wide experimentation with numerous incentive plans devised by Frederick W. Taylor and his colleagues. Some of these plans are still in use today, such as the Halsey, Rowan, and Bedaux systems, but many have been modified.[3] In the 1930's, measured daywork plans were introduced in factories with time-payment systems, incorporating a measure of control of worker performance through production standards.[4] Today, an assortment of incentive and time-rated plans offers features which are adaptable to the varying situations found in modern industrial plants.

Incentive workers may receive either piece rates or production bonuses. Payments under incentive systems may be based on either individual or group performance. Time-rated wage plans include both formal and informal arrangements. The former provide single rates or ranges of rates for specific job categories. Pay rates under informal plans are determined primarily by the qualifications of the individual worker (table 1).

Bureau studies since World War II document both the dominance of time-based plans and the gradual drop in the proportion of factory workers paid under incentive systems. A summary prepared in 1947 indicated that for 56 manufacturing industries, 30 percent of

---

[1] Estimates of the number of production workers within the scope of the study and percentages based upon them are intended as a general guide rather than a precise measure of the industry's work force and relative importance of wage payment plans in each industry. Nearly all incentive wage plans provide for a rate guarantee to workers if production standards are not met. For this tabulation, all production and related workers eligible to receive incentive earnings have been counted as incentive-paid workers, regardless of whether they received earnings above guarantees. Plans such as Christmas or yearend bonuses and profit-sharing were not considered as incentive wage plans.

Industry studies nearly always have a minimum establishment size cutoff which may vary between studies for the same industry; establishments under the cutoff usually account for less than one-tenth of the industry's work force. Minimum size cutoffs varied from none for cigarettes, synthetic fibers, and motor vehicles to 250 workers for basic iron and steel; the most common minimum was 20 workers.

[2] Excludes, "stint workers," those receiving a fixed daily rate for a predetermined amount of work regardless of the time required to complete the task.

[3] Less than 0.5 percent.

[4] Information by type of plan was not tabulated for industries with less than 6 percent of the workers paid on a time or incentive basis.

[5] No data reported.

[6] Information not available by type of wage payment.

NOTE: Because of rounding, sums of individual items may not equal totals.

production and related workers were on incentive pay plans.[5] In May 1958, a survey of factory workers' earnings found that 27 percent of all manufacturing production workers were paid on an incentive basis.[6] Data from the Bureau's area wage surveys on incentive pay coverage of plant workers in metropolitan area factories show a drop in coverage from 26 percent in 1961–63 to 20 percent in 1968–70.[7]

This decline in the incidence of incentive pay systems has coincided with lagging productivity gains in manufacturing. A number of studies have related the lag, in part, to worker attitudes and behavior.[8] Advocates of incentive systems have therefore argued that such arrangements are valuable managerial tools for improving efficiency and boosting productivity.[9]

During 1973–80, the median proportion of workers on time rates was 82 percent (chart 1), up from 75 percent for 1961–68.[10] Thirty-one of the 37 industries studied paid a majority of their production workers on a time basis. Eight industries paid time rates to at least 98 percent of their work forces. These were cigarettes, paints and varnishes, petroleum refining, flour milling, industrial chemicals, noncellulosic fibers, motor vehicles, and cellulosic fibers.

Seven of the eight industries share certain characteristics. Their production departments, which employ the bulk of the work force, are equipped primarily with automatic and semi-automatic machinery. Although the equipment requires monitoring, the machine tenders have little or no control over the pace of output. For example, in petroleum refining, crude oil flows almost continuously in closely interrelated refining units from the time it is received until finished products are shipped to customers. Even cigarettes are produced automatically throughout the fabrication, packaging, and inspection processes. Automobile production, although it actively involves workers in the process, is primarily paced by the speed of the assembly line.

In the remaining 23 industries emphasizing time-rated pay, coverage ranged from 97 percent of workers to 55 percent. This variation partly reflected marked differences in production processes and types of machines used. The pulp, paper, and paperboard industry, with 97 percent of its work force paid time rates, uses mechanical and chemical processing equipment and machines that are among the largest in industry, which workers operate and maintain. In contrast, the leather tanning industry, with 55 percent of its production workers on time rates, requires considerable handling of hides and skins. Hand tools are used extensively by such workers as tackers, about three-fourths of whom were reported on incentives in 1973. The equipment in the plants is largely under the control of the operator. For example, machine buffers and embossing-press or plating-press operators, both largely incentive jobs, are responsible for starting and feeding the machines.

Six industries relied chiefly, but not exclusively, on incentive wage payment plans. Incentive coverage ranged from 61 percent in the men's and children's hosiery industry to 80 percent in basic iron and steel. The other four industries stressing incentive systems were women's hosiery, leather footwear, men's and boys' suits and coats, and men's and boys' shirts. The workplaces in these factories, with the exception of basic iron and steel, are equipped with machines that are largely under the control of the operators. In men's apparel (suits and coats, and shirts), for example, sewing machine operators, who account for nearly half of the work force, can exercise considerable discretion over the pace of their work. Moreover, their output is identifiable and measurable. Individual piece rate plans are the leading pay method in the men's apparel, hosiery, and footwear industries, covering between 60 percent and 75 percent of workers. The occupations that are paid hourly rates include those in maintenance and custodial departments.

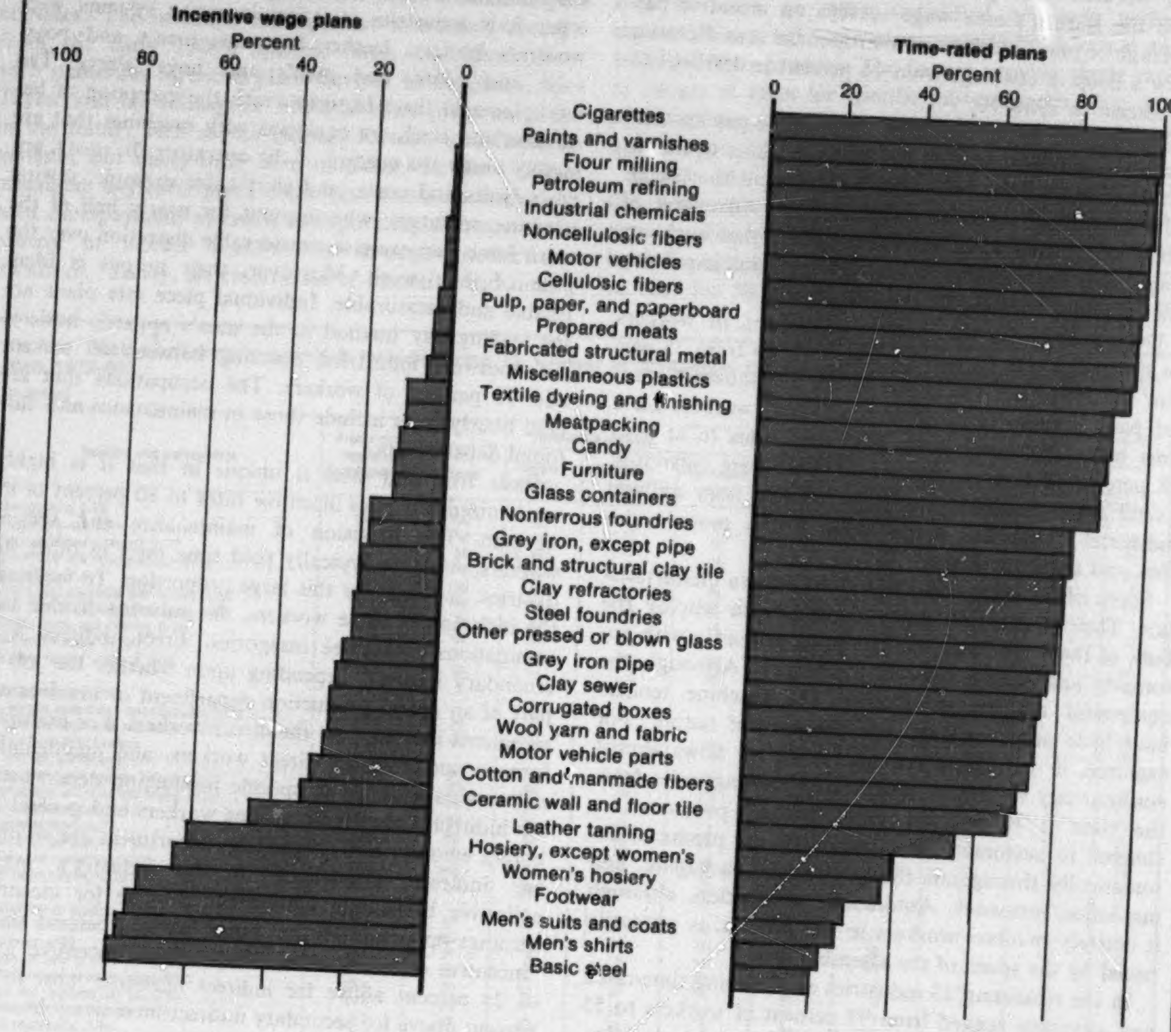
Basic iron and steel is unique in that it is highly mechanized but pays incentive rates to 80 percent of its workers. The inclusion of maintenance and service workers, who are typically paid time rates in other industries, accounts for this large proportion. To facilitate the inclusion of these workers, the industry divided the occupations into three categories, direct, indirect, and secondary indirect, depending upon whether the job is part of an actual production department or involves assignments that support the direct workers. For example, furnace operators are direct workers, and maintenance millwrights assigned to specific production departments are indirect. Other maintenance workers and general laborers who are not assigned by department are secondary indirect. Guidelines in the industry's major collective bargaining agreements provide for incentive earnings opportunities that range from 35 percent above "incentive calculation rates"[11] for direct incentive jobs, to 23 percent above for indirect incentive jobs, to 12 percent above for secondary indirect incentive jobs.

Recent trends

In 26 of the 37 industries studied, worker coverage under time-rated systems for 1973–80 increased over that for 1961–68. The increase ranged from as little as 1 percentage point to as much as 26 points (table 2). All but 3 of the 26 industries had already extended time pay to more than half of their production workers during 1961–68. In one of the exceptions, women's hosiery, coverage under time rates rose from 25 percent to 37. In another, men's and children's hosiery, it rose from 30 percent to 39. In the third, leather tanning, coverage increased from 48 percent to 55.

The most striking growth of time-rated pay systems

Chart 1. Percent of production and related workers covered by time-rated or incentive wage plans in selected manufacturing industries, 1973-80



occurred in the glass container industry, where the proportion of time workers rose 26 percentage points, and the meatpacking industry, where it rose by 24. In the glass container industry, 88 percent of production workers were paid time rates in 1980, up from 62 percent in 1964. The expanded coverage is mainly attributable to action taken in the late 1960's to eliminate incentive earnings for large numbers of workers. The major producers and the two leading unions, the Glass Bottle Blowers and the American Flint Glass Workers, recognized that the incentive plans had become cumbersome and costly to administer. They agreed to pay time rates to maintenance and service workers and to some direct production workers who had been on incentives, in exchange for an across-the-board pay increase that ensured no loss in earnings.

In meatpacking, nine-tenths of the production workers were paid time rates in 1979, up from two-thirds in 1963. This increase partly reflects the implementation of time plans in new plants opened by major producers. A comparison of the occupations in multiplant establishments studied in 1963 and 1979 shows a substantial decline in incentive coverage in the cutting, processing, custodial, and material movement departments. Changes in beef-cutting techniques, introduced by a few new producers, also contributed to shifts in pay plan coverage. In the new process, carcasses attached to a conveyor are divided into smaller cuts as each worker on the line performs a limited number of cutting and trimming operations. The cuts are vacuum sealed, boxed, and shipped to supermarkets and butcher shops. Workers in these "boxed beef" occupations, virtually all paid time rates, accounted for slightly more than half the beef-cutting department employment in the 1979 meat products survey.

Other industries reporting increases in coverage under time systems typically experienced a shift to automatic and semi-automatic machines. For example, the dehacking and setting processes in structural clay products manufacturing, once done manually, are now performed automatically in many plants. Many larger corrugated box plants are now almost fully automated, thus eliminating numerous hand operations, such as bundling, packing, and taping.

Only five industries reported increases in incentive plan coverage, mostly marginal. Two of the five (men's and boys' shirts and leather footwear) were predominantly incentive industries in the 1960's, with at least seven-tenths of the workers in each earning piece rates. Only one industry, basic iron and steel, reported a significant increase in incentive coverage, from 66 to 80 percent, between 1962 and 1979. This rise for the industry as a whole largely reflects the impact of developments in the 1968 bargaining round between the United Steelworkers of America and the 11 major companies in the industry. The union reportedly was seeking incentive pay for all workers. Producers hoped to limit the extent of incentive coverage. The impasse led to arbitration. The panel ruled that each of the 11 companies was to extend incentive coverage to at least 85 percent of its production and maintenance employees on a companywide basis, and not less than 65 percent in each plant.

The remaining six industries recorded no change in proportional coverage under the two basic methods of wage payment. Among them are highly automated industries, flour milling, cigarettes, petroleum refining, and the traditionally incentive suits and coats industry. Nonferrous foundries and motor vehicles also reported no change.

Method linked to multiple factors

The choice between time rates and incentive pay depends on such factors as technological and economic environments, managerial preferences, and union philosophies.

Machine-paced production. Highly automated industries virtually rule out incentive wage systems because workers have little or no control over the pace of production or the volume of output. Conversely, incentive pay is widespread in industries where workers can exercise such control.

Table 2. Percentage of production and related workers covered by time-rated wage payment plans in selected manufacturing industries, 1961–68 and 1973–80

Industry	Percentage of time-rated workers		Percentage point change
	1961–68	1973–80	
Glass containers	62	88	+26
Meatpacking	66	90	+24
Other pressed or blown glass	64	79	+15
Cellulosic fibers	84	98	+14
Candy and other confectionery products	75	89	+14
Brick and structural clay tile	68	80	+12
Women's hosiery	25	37	+12
Corrugated and solid fiber boxes	64	75	+11
Ceramic wall and floor tile	58	68	+10
Hosiery, except women's	30	39	+9
Miscellaneous plastics products	87	95	+8
Wood household furniture, except upholstered	80	88	+8
Pulp, paper and paperboard mills	90	97	+7
Grey iron except pipe and fittings	75	82	+7
Leather tanning and finishing	48	55	+7
Industrial chemicals	95	99	+4
Prepared meat products	92	96	+4
Fabricated structural metal	92	96	+4
Clay refractories	76	80	+4
Steel foundries	75	79	+4
Motor vehicle parts	69	73	+4
Paints and varnishes	98	100	+2
Grey iron pipe and fittings	75	77	+2
Wool yarn and broadwoven fabric	73	75	+2
Cotton and manmade fiber textiles	68	70	+2
Textile dyeing and finishing	89	90	+1
Cigarettes	100	100	0
Flour and other grain mill products	99	99	0
Petroleum refining	99	99	0
Motor vehicles	98	98	0
Nonferrous foundries	82	82	0
Men's and boys' suits and coats	25	25	0
Noncellulosic fibers	99	98	−1
Clay sewer pipe	77	76	−1
Men's and boys' shirts	23	22	−1
Leather footwear	30	27	−3
Basic iron and steel	33	20	−13

To illustrate, the amount of fixed assets per worker was compared with the incidence of time-rated workers for 35 of the 37 industries. The assumption was that the higher levels of assets per worker reflected more machine-paced operations and, therefore, would be associated with higher worker coverage under time pay.[12]

The heavy processing industries with per-worker assets well above the $25,000 median for the group have higher incidences of time-rated workers. The traditional incentive industries showed assets ranging between $3,000 and $13,000. Again, the exception among the heavy industries is basic iron and steel. Unlike the extremes in this comparison, the middle group of industries in terms of per-worker assets produced a mixed pattern of pay plans and asset levels.

Among this middle group are fabricated structural metals and nonferrous foundries, whose high proportions of time workers and low levels of assets are partly attributable to certain characteristics of these industries.

They are composed mostly of small to medium size job or order shops, producing varied product lines in short production runs. Such conditions of constant change and nonstandardized tasks make incentive systems difficult, if not infeasible, to install.

Managerial preferences. The technological and economic environment clearly determine the feasibility of a pay method in certain industries.[13] But in others, more subjective factors may influence managers. Among these are the complexities involved in designing and implementing incentive plans. For example, rather than undertake the costs and uncertainties involved in establishing performance standards that effectively motivate the worker, some managers prefer to pay hourly rates. Difficulties in making allowances for conditions that might reduce a worker's full production potential, such as frequent interruption in the flow of materials or mechanical breakdowns, also argue against incentive plans.

The more complex the design of an incentive plan, the more care is required in administering it. Foremen can become preoccupied with recording nonstandard conditions and handling questions and grievances on rules relating to work flow and work distribution. If only part of the production work force receives incentive wages, a feeling of inequity can develop among timeworkers whose jobs rank higher in terms of education and responsibility, but not in pay. These conditions can, of course, generate inefficiencies in the workplace.[14]

Complications that emerge during periods of rapid innovation tend to compound these problems. Changes in production facilities, techniques, or product assortment require revision of performance standards if worker motivation and effort is to be maintained. If standards are not redefined to fit changing conditions, incentive plans may become "demoralized."[15] This term implies high levels of earnings for low levels of effort. Eventually, such conditions can affect a plant's competitive position.

Union preferences. Trade unions have not maintained a consistent position on methods of wage payment.[16] Union preferences have been influenced by an industry's technological and economic environment and by their goal of rewarding workers equally for the same kind of work.

In those industries where incentive plans could be reconciled with this goal, unions have adapted to incentives. The majority of these industries are characterized by labor intensive production methods and a highly competitive product market. In certain apparel industries, for example, unions historically have negotiated the schedule of piece rates, thus achieving some control over worker pay.

Unions have been able to harmonize their goal with the use of incentives, even in highly mechanized industries such as basic iron and steel. Underlying the incentive system in basic steel is a common job and pay system designed jointly by the Steelworkers and the major producers. This system is based on a highly uniform job evaluation procedure among the companies that assigns point values to jobs on the basis of 12 factors that include such major concerns as experience, skill, responsibility, effort, and working conditions.

Other approaches to motivation

The post-World War II growth in time-rated pay systems has been accompanied by concern over rising inefficiencies in the workplace. Questions are being raised as to the effectiveness of methods of pay as motivators, and attention is focusing on other means to improve efficiency.[17]

Pay methods tap the self-interest of the worker, but many of the other approaches are designed to help the worker identify with the long-term interests of the enterprise. Such identification would presumably result in better interpersonal relationships, stronger job interest and satisfaction, less absenteeism and waste, and lower rates of turnover, all of which would lead to productivity improvements.[18]

Productivity enhancement, however, is not the sole objective of these approaches, known generally as quality-of-worklife improvement programs. This umbrella term covers a diversity of ventures, a number of which are still both experimental and controversial. In some instances, allegedly, the programs have been introduced to circumvent union representation. In other instances, they have had joint union-management sponsorship.[19] Some quality-of-worklife programs explicitly link financial reward to program results. Other approaches stress such motivators as the worker's need for personal fulfillment on the job, recognition, and involvement in corporate decisionmaking.

Among the quality-of-worklife approaches that are compensation related are Scanlon plans. Initiated by the late Joseph Scanlon in the 1930's, they are designed to motivate all employees to improve production methods and to suggest ways to cut costs. One of the important elements of Scanlon plans is a system of joint shopfloor and plantwide review committees that meet regularly to discuss and evaluate worker suggestions for work improvement. Another unique feature is a plantwide incentive arrangement based on measuring productivity changes and a formula for distributing savings in the form of monthly bonuses.[20]

Other efforts link rewards to the overall profitability of the firm, such as profit-sharing and stock plans. Profit-sharing cash plans usually distribute a part of profits to employees annually. Under deferred versions, the employer makes payments to a trust for the benefit of the employee, who usually receives final distribution at retirement.[21] Stock plans traditionally permitted employees to buy company stock, often at a discount, through payroll deductions over a year. The stock purchased was distributed shortly after the closing date specified. However, under current employee stock ownership plans, delivery is deferred until the employee leaves the plan or retires. Because of special tax benefits enacted in 1975, the number of such plans has grown from about 200 in 1975 to nearly 5,000 plans in 1980.[22]

Not all programs that seek to promote worker support of collective goals of the firm are directly linked to compensation. Some draw upon the expertise and creativity of the work force to help redesign and reorganize production operations, thereby involving workers in decisionmaking. Although not always a primary objective, productivity improvement has been reported as a result of some of these efforts.[23] Interest in worker participation in decisionmaking has grown since the early 1970's, even though the concept was discussed much earlier. The basic framework for worker participation is the labor-management committee, which functions as an advisory body to management on a wide assortment of workplace issues. These issues range over topics such as absenteeism, safety, waste reduction, reorganization of the shopfloor, forecasting manpower requirements, and training programs. Such committees can now be found in a wide variety of industries, including basic steel and auto manufacturing.[24] Generally, committees in organized plants are separate from the collective bargaining framework. In the case of the United Auto Workers-General Motors approach, the members of the local union shop committee serve on the quality-of-worklife committee.[25]

Another type of advisory group, Quality Circles, has recently gained prominence. Unlike labor-management committees, these bodies are composed solely of employees. They meet voluntarily on company time to define workplace problems, discuss solutions, and formulate strategies to eliminate the problems.[26]

THE TREND TOWARD PROGRAMS that enhance workers' roles in factories will probably continue as labor and management search for ways to make the workplace more efficient. The movement reflects in part, changing perceptions by workers, unions, and managers, of their roles. There is little likelihood, however, that the relative incidence of time and incentive methods of pay in U.S. plants will change greatly from present levels, given the dominance of machine-paced operations. ☐

FOOTNOTES

[1] The sample is relatively small because several manufacturing industries in the wage survey program were excluded either for lack of nationwide statistics or historical data. These include women's and misses' dresses, drug manufacturing, nonelectrical machinery, semiconductors, electrical transmission and distribution equipment, millwork, upholstered furniture, and shipbuilding and repairing. Because of the limited number of industries studied, no generalizations are drawn about methods of wage payment for all manufacturing.

[2] This analysis is limited to production and related workers in manufacturing. Thus, commission plans for sales workers and various piece-rate arrangements in transportation are outside the scope of this article.

[9] Vincent G. Reuter, "Wage Incentives: a Valuable Productivity Tool," *Journal of Systems Management*, October 1980, pp. 27–33, points out how work study programs and wage incentives can increase productivity and reduce costs. Also see *Forms of Wage and Salary Payment for High Productivity*, the final reports of an International Management Seminar sponsored by the Organization for Economic Cooperation and Development in 1967. The report, published in 1970, explores the advantages and disadvantages of wage incentives.

[10] Integral to nearly all incentive wage plans is a rate guarantee if the production standards are not met. For purposes of this article, all production and related workers eligible for incentive earnings have been counted as incentive-paid workers, regardless of whether they received above-guaranteed earnings.

[11] An incentive calculation rate is specified for each of the 34 job classes that compose the common job and pay system. Straight-time pay for incentive workers is computed by applying a percentage, usually based on a group production bonus, to the incentive calculation rate before combining with an hourly additive, which includes cost-of-living adjustments. In each job class, the sum of the incentive calculation rate and hourly additive equals the basic hourly wage rate. For greater details, see Joseph C. Bush, "Incentive pay patterns in the steel industry," *Monthly Labor Review*, August 1974, pp. 75–77.

[12] Information on the gross value of fixed assets and the number of production workers was obtained from the 1977 Census of Manufactures. Thirty-five, instead of 37, industries are included because the industry definitions for motor vehicle parts and gray iron pipe foundries used by the Bureau of Labor Statistics industry wage surveys differed from those used by the Bureau of the Census.

White-collar pay levels linked to corporate work force size

Larger-size firms generally pay high salaries for white-collar workers, although the pay advantage varies by occupation and skill level

MARTIN E. PERSONICK AND CARL B. BARSKY

"It may seem paradoxical that buyers of labor with the most monopoly power generally pay the highest rates of wage and benefit compensation." With this provocative thought, Professor Richard Lester in his comprehensive 1967 study invited the next generation of researchers to explore size-of-establishment differences in employee compensation.[1] In response, researchers during the past 15 years have "rediscovered" this once-neglected field as fertile ground for debate. While most have argued that big employers pay employees more, others contend that size, *per se*, is not a determinant of wage levels but rather reflects marked differences in the quality of workers employed by large and small firms. Responding to his own paradox, Lester suggested several reasons a large employer might pay higher wages than other firms, including: public opinion, ability to pay, and as compensating differentials for the "impersonal and confining aspects of large establishments."

This article examines the relationship between work force size and pay levels of white-collar employees, using data from the Bureau of Labor Statistics national survey of professional, administrative, technical, and clerical pay (PATC). By using the narrowly defined occupational work levels of the PATC survey, this analysis limits the distorting effects of variations in worker quality on pay levels. The principal findings of the analysis are: pay levels tend to increase with employer work force size but above-average levels are associated only with large firms; and wage premiums attributable to a firm's size are larger for entry level than for experienced professional workers—an indication of competition among small and large employers to attract and retain skilled personnel.

Past studies of the links between work force size and pay levels have reviewed several other possible explanatory variables relating to establishment or worker characteristics, or both. The variables included here were chosen on the basis of significance in previous analyses and availability in the data source selected—the 1980 national PATC survey. The variables are: two measures of work force size (number of employees in the establishment and world-wide corporate employment of the establishment's parent company); industry division (for example, manufacturing, trade, or services); and geographic location (four Census regions). Data on union status, missing from the PATC survey, were developed from the BLS area wage survey program; but these industry averages of unionization proved to be highly correlated with the industry variable and thus were excluded from the final regression analysis. Their omission probably had only minimal impact on this analysis, based on a recent study that showed relatively small union wage differentials for white-collar employees, and no discernible effect on the work force size variables when the union variable was excluded.[2]

Controlling for variations in worker quality continues to be an obstacle to accurate measurements of wage premiums attributable to work force size. For example, a

Martin E. Personick is a project director and Carl B. Barsky is an economist in the Division of Occupational Pay and Employee Benefit Levels, Bureau of Labor Statistics.

BLS researcher found that half of the apparent size premium disappeared when traditional proxies for worker quality—education and work experience—were included in an analysis of data from households sampled in the Current Population Survey.[3] Other researchers have also pointed to unmeasured individual worker characteristics such as dependability, tenure, and "firm-specific" training in espousing reasons for finding a positive relationship between work force size and pay levels.[4]

This study limits the direct influence of education and work experience on salary levels by grouping workers into occupational classifications that are each narrowly defined to represent comparable job content among establishments.[5] This approach departs from previous studies where educational background and overall work experience are important determinants of the distribution of workers among occupations, and thereby influence earnings. However, education and experience are relatively uniform for workers within a specific PATC-defined occupation and, as a rule, are less influential in explaining pay variations among individuals performing the same or similar tasks.

Analytical techniques and data

Two basic approaches are followed in this analysis: (1) cross-tabulation of pay levels by corporate employment size group and (2) multiple regression techniques. The first approach measures gross pay differentials because it does not control for interplay among the various possible influences on pay levels. On the other hand, multiple regression measures the net effect of each explanatory variable, such as work force size, after allowing for the influence of other variables in the equation.

As previously mentioned, the 1980 PATC survey of about 3,500 private sector establishments is the data source for this analysis. Conducted annually by the Bureau of Labor Statistics, the survey results provide the basis for recommendations on annual pay changes for Federal white-collar employees. Selection of PATC survey occupations and other specifications as to the coverage of the study, such as minimum employment size of the establishments, industrial coverage, and geographic scope, are the responsibility of the President's Agent (Secretary of Labor and heads of the Office of Management and Budget and the Office of Personnel Management), under the Federal Pay Comparability Act of 1970.[6] The narrowly defined occupational classifications of the survey provide the link between private and Federal Government sectors thereby permitting carrying out of the congressional directive that "Federal pay rates be comparable with private enterprise pay rates for the same levels of work."[7]

The March 1980 PATC survey included 21 occupations, and all but one were divided into two work levels or more. Each level describes duties and responsibilities in private industry that are comparable with those of specific Federal white-collar employees. Of the 91 occupational work level (job) categories in the survey, 25 contain enough workers for this analysis. They are distributed over 12 of the 21 surveyed occupations, and include professional/administrative, technical support, and clerical workers.[8] Straight-time earnings of full-time workers, the measure reported in the PATC survey, forms the basis for this analysis of pay levels.

Cross-tabular results

Cross-tabulations revealed a strong tendency for pay levels to rise, as corporate employment grew. (See table 1.) Depending on the job category, pay ranged from 1 to 16 percent below the PATC survey averages in firms with fewer than 1,000 workers to 4 to 24 percent above in firms with 250,000 workers or more. Table 1 also presents clerical and technical workers in the largest corporate categories as enjoying a somewhat greater pay advantage than their professional colleagues.

For professionals, the pay advantage for working in large corporations was less at journeyman level than at entry level, indicative of competition among small and large firms alike for experienced workers.[9] The higher

Table 1. Relative pay levels by corporate employment-size group, selected white-collar occupations in private establishments, March 1980

Occupational level and Federal equivalent	Mean salary for size groups as a percent of surveywide average[1]					
	Fewer than 1,000 employees	1,000 to 2,500	2,500 to 10,000	10,000 to 50,000	50,000 to 250,000	250,000 or more

[3] Insufficient employment in one work level or more to warrant separate presentation of data.

average pay for entry-level professionals in large firms may partly reflect payment for a "higher quality" of worker, that is, the academic reputation of the college from which he or she graduated or higher standing within the graduating class. In contrast, past work experience and job performance are less important in setting salaries for beginning professionals whose job tenure is brief.

These overall comparisons mask the degree to which pay in individual firms deviated from group averages. As a rule, less than half of the firms with 50,000 workers or more paid their nonclerical employees at least 5 percent above PATC survey averages; by individual job category, the proportion of employers ranged from 25 to 58 percent. For clerical jobs, the proportions ranged from 54 to 63 percent. Similarly, not all firms in smaller-size groups paid less than the average. For each job, at least 7 percent of the employers with fewer than 1,000 workers paid 5 percent or more above the survey average.

Variations in industry pay levels (table 2) and employment distributions (table 3) appear to account for part of the differences in pay levels between large and small firms. To illustrate, the five occupational work levels shown in table 3 have a disproportionately high number of manufacturing industry workers in large firms. Conversely, finance, insurance, and real estate workers in these job categories (service industry for engineers) tend to concentrate in small firms. As in the blue-collar sector, white-collar pay levels are higher in manufacturing[10] than in either finance, insurance, and real estate or service industries. Pay levels of medium-size firms (2,500 to 10,000 workers) are bolstered by the presence of public utilities—traditionally one of the highest-paying industry sectors.

Unlike the aforementioned association between size of firm and industry, corporate size appears to be largely independent of regional location. Accordingly, regional pay differences do not seem to account for much of the wage premium associated with work force size. Moreover, pay differences between the highest- and lowest-paying regions were relatively small—typically less than 10 percent. As noted in a previous BLS study,[11] a regional pay advantage may reflect more the industry orientation of a particular job, such as the Southern pay premium traditionally reported for chemists who are extensively employed by high-paying petrochemical firms in that region.

Regression results

Multiple regression analysis disclosed a statistically significant relationship between large corporate size, *per se*, and higher pay, when other measured characteristics are held constant. This was true for all but one (engineering technician V) of the 25 job levels studied. In some cases, as illustrated in table 4, pay in firms with 250,000 employees or more averaged 9 to 20 percent above firms with fewer than 1,000 employees.[12] A smaller size premium, found less often, was reported for

Table 3. Relative industry employment levels by corporate employment size groups, selected white-collar occupations, March 1980

Occupation and industry division[1]	Percent of workers in:			
	All size groups	50,000 or more[2]	2,500 to 10,000	Fewer than 1,000
Accountants III:				
Manufacturing	65	78	55	41
Public utilities	9	4	21	7
Trade	7	9	6	15

Finance, insurance, and real estate	42	22	40	61
Services	5	4	6	5

[1] See table 2, footnotes 1 and 2 for coverage of nonmanufacturing industry divisions. Industry divisions with less than 5 percent of the workers in an occupational work level are not shown.

[2] The two largest-size groups shown in table 1 were combined to provide sufficient observations for a meaningful profile of industry employment distribution of relatively large corporations. To simplify this analysis, the medium-size firm is represented by the 2,500 to 10,000 employee group, omitting corporations with 1,000 to 2,500 and 10,000 to 50,000 employees.

[3] Less than 4 percent.

the second and third largest corporate-size groups. Below the 10,000 worker cutoff, significant size premiums were usually absent—not surprising given the relatively small differences in actual pay levels among the three smallest size groups. (See table 1.)

Substituting establishment size for corporate size in the regressions did not alter the basic findings that large employers provide higher pay levels for white-collar workers. For a large majority of the 25 job levels, significant pay premiums attributable to establishment size began with the 1,000 to 2,499 employees group; for the largest establishments (10,000 employees or more), the size premium over the smallest group (fewer than 500 employees) was typically 10 to 15 percent for professional/administrative categories and 20 percent or more for the clerical/technical job levels.

The simultaneous effect of establishment and corporate size on pay levels also was tested in separate sets of regressions. The work force variable was defined as four combinations: (1) small establishment (fewer than 2,500 employees)/small corporation (fewer than 50,000 employees); (2) small establishment/large corporation; (3) large establishment/small corporation; and (4) large establishment/large corporation. Compared with the small establishment, small corporate-size category, the other three groups had statistically significant salary differentials for a large majority of the 25 job categories studied. However, of the three, only the large establishment/large corporation group stood out with significant salary premiums for all jobs.

Of the two work force size measures used, corporate size generally provided a better explanation of the salary variation for professional job categories, that is, higher adjusted coefficients of multiple determination ($\hat{R}^2$), while establishment size produced somewhat better regression results for clerical positions. This is consistent with and may partly reflect the differing pay-setting practices of the two occupational groups: a national or regional market for professionals and a local wage area for clerical workers. Regardless of the work force size measure used—corporate or establishment—regression results explained more of the salary variation for entry-level than for higher-level professional job categories. This is in line with the more uniform work experience and job tenure noted for entry-level professionals than for journeymen.

Salary differences found by simple cross-tabulation (table 1) can be labeled *gross* differentials, and those isolated by multiple regression techniques, *net* differentials. Table 5 compares gross and net percentage pay differentials associated with corporate work force size. The table shows that gross differentials are generally larger than net differentials. This expected pattern reflects the tendency for characteristics associated with higher pay

Table 4. Regression analysis of average monthly salaries for selected white-collar occupations, March 1980

Variable	Percent of 25 occupations studied with significant coefficients [1]	Accountants III	Engineers III	Computer operators III	Accounting clerks III	Typists I
		(Coefficients shown in percent)				
Constant	N.A.	$1,725	$1,913	$1,080	$919	$772
Corporate size (number of employees):						
1,000 to 2,499	20	...	...	...	...	...
2,500 to 9,999	20	...	...	...	...	...
10,000 to 49,999	60	4.7	5.4	4.8	10.3	...
50,000 to 249,999	76	7.2	4.7	8.6	14.9	9.6
250,000 or more	96	19.6	12.5	17.5	17.7	9.0
Industry division:						
Mining/construction	64	8.3	3.3	−10.3	10.4	...
Public utilities [2]	80	8.1	5.3	7.9	13.5	13.4
Finance, insurance, and real estate	71	...	...	−8.7	−7.2	−13.9
Wholesale trade	26	...	...	...	...	−14.5
Retail trade	68	4.3	...	6.2	−7.3	−15.4
Selected services [2]	24	...	...	−12.7	...	...
Region:						
Northeast	60	−7.7	−3.7	−4.1	3.8	...
North Central	36	−3.0	...	...	5.4	5.4
West	52	−2.5	...	6.4	4.2	6.2
Statistical information:						
Adjusted coefficient of determination ($\hat{R}^2$)	N.A.	.23	.12	.21	.20	.21
Mean (Y)	N.A.	$1,776	$2,013	$1,079	$1,029	$759
Number of observations (S)	N.A.	1,476	1,154	1,174	1,534	854

[1] Because the regression coefficients are based on a sample, they may differ from the figures that would have been obtained from a complete census. Chances are about 2 in 3 that an estimate from the sample would differ from those in a total census-derived value by less then the standard error, and about 19 in 20 that the difference would be less than twice the standard error. It is the latter 5 percent significance level that is used here; the percent of the 25 occupations studied that had a significant coefficient is shown for each variable, for example, only 20 percent for the 2,500 to 9,999 corporate size-group.

[2] See table 2, footnotes 1 and 2 for coverage of nonmanufacturing industry divisions.

NOTE: Y is the mean of the earnings (dependent) variable weighted by occupational employment. S is the number of establishments in the sample with employees in the occupations studied. Dashes indicate that the coefficient was not significant at a 5 percent level. N.A.=Not applicable.

Table 5. Percentage earnings differences between large and small firms, selected white-collar occupations, March 1980

Occupational work level	Percent difference	
	Gross	Net
Accountants I	38.6	33.9
Accountants III	21.3	19.6
Accountants IV	12.4	13.3
Auditors III	31.5	20.0
Buyers III	14.1	15.6
Buyers IV	21.1	20.8
Chemists II	24.7	19.7
Chemists IV	16.1	13.1
Engineers I	20.5	19.0
Engineers III	12.6	12.5
Engineers VI	6.1	9.0
Engineers VII	9.5	11.3
Computer operators III	24.5	17.5
Computer operators IV	31.8	21.5
Drafters II	33.3	37.4
Drafters IV	16.5	19.1
Engineering technicians III	15.1	13.8
Engineering technicians V	14.1	[1] 12.4
Accounting clerks II	22.1	17.3
Accounting clerks III	26.4	17.7
Key entry operators I	36.3	27.4
Key entry operators II	37.8	31.4
Secretaries II	34.1	29.2
Secretaries IV	48.4	41.3
Typists I	22.1	9.0

[1] The net difference for engineering technicians V is statistically significant at a 10-percent level; all other work levels shown are significant at 5 percent.

NOTE: Large size equals 250,000 employees or more; small size, fewer than 1,000 employees. "Gross" and "net" differentials are defined in the text.

levels, such as high-paying manufacturing and large corporate size, to be found together. This compounds the impact attributable to any single characteristic by simple cross-tabulation. Regression techniques separate such combinations and measure the impact of individual components.

Implications for future research

This study illustrates the usefulness of surveys that provide detailed information on narrowly defined occupations, which control for differences in worker quality. It makes clear that questions relating to work force size and occupational pay seem more appropriate for an establishment survey than a household one. Yet, as noted earlier, the inclusion of information on the educational background and work experience of employees (easier to get in household interviews) enhances the usefulness of most size/pay estimates. Two BLS studies have utilized the best features of both approaches: in 1972 a study of the clothing industry obtained for the first time demographic characteristics from employee interviews and occupational wages from their employers[13] and a subsequent study matched observations on individuals and their employers from two establishment surveys—Employer Expenditures for Employee Compensation and Area Wage Surveys—and the Current Population Survey of households.[14] Either approach, although expensive and time consuming, is necessary to adequately control for productivity differences among workers.

The corporate work force variable could be redefined in future surveys to report the work force size for a parent company only if it has a direct input to the wage and salary administration of its affiliated establishments. This study included corporate work force obtained for both *divisions* of companies whose pay decisions are usually reviewed by the parent firm and for *wholly-owned subsidiaries* that operate independently of that type of review. This proposal would reduce the number of affiliates reported in the largest corporate-size classes and probably would tend to increase the pay differential between large and small employers.

Finally, if resources were made available, two other establishment characteristics could be added to the PATC survey to help improve explanations of white-collar pay levels—union status of white-collar and of blue-collar workers and location by area population size. The latter may be especially important for clerical and technical job categories. A metropolitan/nonmetropolitan area variable was not included in this analysis because more than 90 percent of white-collar workers covered by the PATC survey were employed in metropolitan areas.

IN SUMMARY, this analysis found white-collar pay levels generally increasing with employer size. This was observed both before and after allowing for the impact of other measured variables, such as industry and region. However, the amount of the salary premium attributable to work force size varied by occupation and skill level—similar to the way education and other worker quality traits have affected results in previous studies. Narrowly defined occupational classifications broaden opportunities for BLS establishment surveys to be used in research usually reserved for household-type surveys. Further improvements in both kinds of surveys, and combining their best features, are needed to better measure and control for differences in productivity-related characteristics among workers. ☐

[4] See, for example, Stanley H. Masters, "Wages and Plant Size: An Inter-industry Analysis," *Review of Economics and Statistics*, August 1969, pp. 341–45 and Walter Y. Oi, "The Fixed Employment Costs of Specialized Labor," paper presented at Conference on The Measurement of Labor Cost, December 1981, at Williamsburg, Virginia.

In Vladimir Stoikov, "Size of Firm, Worker Earnings, and Human Capital: The Case of Japan," *Industrial and Labor Relations Review*, July 1973, the author argues that size of enterprise is of minor importance and that interfirm wage differentials are explained almost exclusively by differences in worker skills and knowledge.

[5] Occupational definitions are presented in *National Survey of Professional, Administrative, Technical, and Clerical Pay, March 1980*, Bulletin 2081 (Bureau of Labor Statistics, 1980), pp. 38–68. Several occupations used in this analysis have exclusions that help to narrow their definition. For example, the accountant definition does not cover workers whose principal or sole duties consist of designing or improving accounting systems or other nonoperating staff work, such as budget or financial analysis; the computer operator definition includes workers operating the control console of a digital computer and not those operating computer terminals; and the typist definition does not include word processors and publication typists. In addition, workers without college degrees are almost always excluded from the professional jobs studied.

[6] The industrial coverage and minimum-size establishment is as follows: manufacturing (100 or 250 employees); transportation, communication, electric, gas, and sanitary services (100 or 250 employees); mining and construction (250 employees); wholesale trade (100 employees); retail trade (250 employees); finance, insurance, and real estate (100 employees); and selected services (50 or 100 employees).

[7] 5 U.S.C. Sec. 5301 (a) (3) (1970). The pay-setting role of the PATC survey is described in George L. Stelluto, "Federal pay comparability: facts to temper the debate," *Monthly Labor Review*, June 1979, pp. 18–28.

[8] Table 1 lists the 25 job categories. Work levels are identified by Roman numerals, the higher the numeral the greater the duties and responsibilities. Numbers of work levels in the PATC survey vary by occupation, ranging from one for messengers to eight for chemists and engineers. For professional occupations, the first two levels are considered entry and developmental; the next two levels, journeymen; and higher levels, generally supervisory or managerial in nature.

[9] Microdata from the PATC survey have shown over the years that pay levels within an establishment are typically higher relative to the survey-wide averages for experienced levels of professional positions than for entry levels. This is especially true for small, relatively low-paying establishments.

[10] Previous BLS research on area pay differences found that wage variation reflects not only the relative presence or absence of manufacturing activity but also the kind of manufacturing industries. We found that this also applies to occupational pay differences by size of firm. That is, high-paying manufacturing industries were relatively more important employers in the largest firm-size groups. For example, in the large-size groups (50,000 employees or more), two-thirds of the accountants III employed by manufacturing firms were in high-paying industries; in the small-size group, the corresponding proportion was two-fifths. An industrial profile of large, low-paying firms, that is, with pay levels 5 percent or more below the PATC survey averages, showed that their mix of manufacturing industries, like that of small firms, was less favorable than for the large firm-size groups as a whole. The data to support these findings for other jobs studied are available upon request.

[11] Harry F. Zeman, "Regional pay differentials in white-collar occupations," *Monthly Labor Review*, January 1971, pp. 53–56. Because the PATC survey was designed to yield nationwide data, regional estimates are not regularly published; small differences in these estimates should be cautiously interpreted.

[12] Several categories were defined for each characteristic studied, for example, six corporate employment-size groups or four geographic regions. (Actual employment rather than employment groups was not available.) The coefficients presented in table 4 are the percent differences between the category of each characteristic that is shown and the one that is not shown, but is embodied in the "constant" term: that is fewer than 1,000 workers, manufacturing, and the South.

Can the NLRB caseload detect changes in labor relations climate?

MARK D. KARPER

The past 30 years have been marked by a steady increase in the number of unfair labor practices cases processed by the National Labor Relations Board (NLRB). This raises questions concerning possible changes in the distribution of this increase over the 1950–78 period. An assessment of what, if any, changes have occurred can provide indicators of changes in the labor relations climate over time. The assessment of changes in the distribution of cases can be broken down into five specific categories (a) changes in regional distribution, (b) changes in the type of employer, (c) changes in the size of an employer, (d) changes in the type of cases, and (e) changes in election behavior relative to cases.

The NLRB provides information on the total number of unfair labor practices cases for the 10 census regions of the United States.[1] It categorizes changes in managerial violations for each region. The results for such violations show four regions declined since 1950: the Middle Atlantic, Outlying areas (Virgin Islands and Puerto Rico), New England, and West South Central; and six regions increased their share: East North Central, Pacific, South Atlantic, Mountain, West North Central, and East South Central. The most dramatic changes occurred in Ohio, Indiana, Illinois, Michigan and Wisconsin, where the share increased by 4 percent and in New York, New Jersey and Pennsylvania, where it declined by 6 percent. All the changes for the other regions were less than 2 percent, making it impossible to assess whether any consistent trends have developed.

An examination of violations by management according to the type of employer reflects the demographic shift of employment from the manufacturing to the services sector. In addition, it reflects increased NLRB jurisdiction in the services sector with the addition of health care institutions, private, higher education institutions, and the U.S. Postal Service. The services sector's share of unfair labor practices cases by management increased from 4.1 percent in 1950 to 17.7 percent (includes Postal Service) in 1978, while the manufacturing sector declined from 61.7 percent to 45.8 percent. Transportation, finance, retail trade, construction, and mining increased slightly (less than 2 percent), while wholesale trade declined 1.4 percent.[2]

Data on unfair labor practices cases by the size of the employer are available going back to 1966. The data show little variation over the entire time period with an average of 65 percent of all cases being filed against employers with less than 100 employees, 12 percent in the range of 100–499, 5 percent in the range of 500–999, and 9 percent with employees of 1,000 or more. The data vary by less than 2 percent over the entire time period in any one category. These results reveal that over the recent time period for which the data are available, the size of the employer is not an important factor in the change in the distribution of cases.

One measure of the mix of unfair labor practices cases is the ratio of union to management violations. This mix has changed over time with unions' violations rising faster than managements', with the ratio becoming stable from 1966–78. The relative stability of the union and management mix in recent years means that they have shared equally in the growth of cases indicating the increased use of litigation by both sides.

Election petitions by unions could be related to the incidence of unfair labor practices cases if violations arise in substantial numbers from elections. During 1964–78, the number of these elections remained almost constant while cases almost tripled. This fact negates any simplistic relationship between the two. The data

---

Mark D. Karper is assistant professor of industrial relations, LeMoyne College, Syracuse, N.Y. His full IRRA paper is entitled, "Changes in the Labor Relations Climate: The Evidence from NLRB Caseload."

concerning election activity by type of industry do follow the pattern set by managements' violations. Specifically, there was a decline in the number of elections in the manufacturing sector (22 percent), with a corresponding increase in the services sector (20 percent). The other sectors remained almost constant. The most startling statistic is that election patterns by region remained stable for the entire 1950–78 period, with only one category, the Southern Atlantic Region, (2.9 percent) showing any variation over 2 percent. This pattern runs contrary to demographic shifts in both population and employment.

In summary, increased incidence of unfair labor practices cases is not due to the movement of employment to the South and West, for example. Second, the increase in cases is not due to increased lawlessness on the part of employers or unions, since the mix of union and management violations has remained constant in recent years. Third, there is evidence to indicate that the increase in cases may be related in part to the increased jurisdiction by the NLRB in the services sector. And, finally, it is not possible to determine whether this increase reflects a trend towards lawlessness without adequate measures of the number of employees and the scope of bargaining units under NLRB coverage. ☐

FOOTNOTES

[1] The definitions of each region are: New England—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut; Middle Atlantic—New York, New Jersey, Pennsylvania; East North Central—Ohio, Indiana, Illinois, Michigan, Wisconsin; West North Central—Iowa, Minnesota, Missouri, North Dakota, South Dakota, Nebraska, Kansas; South Atlantic—Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida; East South Central—Kentucky, Tennessee, Alabama, Mississippi; West North Central—Arkansas, Louisiana, Oklahoma, Texas; Mountain—Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada; Pacific—Washington, Oregon, California, Alaska, Hawaii, Guam; Outlying—Puerto Rico, Virgin Islands.

[2] The definitions of labor sectors correspond to Standard Industrial Classifications.

Determinants of health insurance and pension coverage

WESLEY S. MELLOW

Fringe benefits have increased markedly in recent years and now account for roughly one-third of total compensation.[1] Despite this magnitude, relatively little is known about the distributional pattern of fringes across workers; most studies of the determinants of fringe benefits use establishment or industry data.[2] While these studies provide much interesting and useful information, they have the same inherent limitation as those which use establishment or industry data to study wages. That is, only very limited controls for labor quality and other interworker differences are available. Consequently, to the extent that observed determinants of fringes (unions, employer size, and so forth) are correlated with worker characteristics influencing total compensation, the estimated effects of these factors will be biased.

The following discussion describes a very rough attempt to address this limitation using new data on individual workers from the Current Population Survey. Specific attention is given to the impact of personal characteristics, union membership, and employer size on health and pension coverage.

Wesley S. Mellow is an economist in the Office of Research and Evaluation, Bureau of Labor Statistics. His full IRRA paper is entitled, "Worker Differences in the Receipt of Health and Pension Benefits: Extending the Analysis of Compensation Differentials."

The data base

The Current Population Survey is the monthly survey of 56,000 households used by the Bureau of Labor Statistics to estimate the official unemployment rate. In addition to data on labor force status and personal characteristics, information is obtained each month on hourly earnings (for workers paid by the hour), usual weekly earnings, and usual hours worked at the primary job from approximately one-fourth of employed survey participants. A special supplement to the May 1979 survey requested information on a wide range of additional worker and job characteristics, including current job tenure, union membership status, employer size, and participation in health and pension plans. For this analysis, the sample is limited to the 18,551 wage-and-salary workers providing responses to the supplemental questions in the May survey and the earnings questions in either the May or June surveys.[3]

Health insurance coverage is determined by response to the question: "Are you included in a group health insurance plan on your present job? Do not report insurance that pays only for accident or disability." Pension plan coverage is determined by the question: "Does your employer or union have a pension or other type of retirement plan for any of its employees?" If the answer is yes, respondents are then asked: "Are you included in such a plan?" (Respondents are told not to include social security, railroad retirement, or veterans' pensions in determining their answers to the pension questions.) Under these definitions, 66 percent of the workers in our sample received health insurance as part of their compensation package and 50 percent received pension coverage.

These percentages are much lower than those typically found in studies based on firm or establishment data.

For instance, a 1977 Chamber of Commerce study found that only 9 percent of the firms it surveyed reported no pension payments, and fewer than 1 percent reported no health insurance payments.[4] Similarly, a recent Bureau of Labor Statistics study found that in 1979 only 13 percent of workers in the establishments surveyed received no pension coverage and only 3 percent received no health insurance.[5] The discrepancy is probably attributable to some combination of the following factors. Not all workers in a firm receive health and pension benefits, relatively new and part-time employees being particularly excluded. In addition, surveys of firms typically exclude "small" employers (in most cases, those with fewer than 100 employees). These small employers have much lower levels of benefit provision. Finally, employer surveys frequently exclude specific occupations or industries which may have low fringes.

It should be noted that a number of sharp differences in the means of the incidence of benefit receipt are readily apparent among the subgroups of the CPS sample. Women, low tenured, and part-time workers have much lower receipt levels, while the converse is true of union workers and those working for large employers. High wages are associated with higher benefit coverage, and wide variations are observed among industries.

Probabilities of coverage

Logit analysis was used to estimate the impact of worker and employer characteristics on the likelihood of health or pension coverage.[6] The coefficients estimated using this procedure indicate the percentage change in the odds of receiving the specified benefit for a unit change in an explanatory variable. Also calculated are the derivatives, which reveal the marginal effect of change in an independent variable on the absolute probability of receiving the benefit, in the vicinity of sample means.

The estimates indicate that several major factors are associated with dramatic shifts in the probability of receiving benefits. Union members and those working in large firms have sharply higher receipt levels. Based on the derivative calculations, the absolute probability of receiving health insurance (pension benefits) is .144 (.321) higher for union members. Regarding employer size, there is an increase of .200 in the absolute probability of health benefits and a .299 rise in the probabilities of pension coverage associated with firms having 25 to 99 workers. Being employed in establishments with 1,000 workers or more increases the absolute probabilities of health and pension coverage by .316 and .557, respectively. Because the mean of the pension variable is smaller than that of the health variable (.50 versus .66), these estimates imply that the relative effects of union membership and firm size are greater on the probability of receiving pension benefits than on the probability of coverage by health insurance plans.

Current job tenure and wage are both associated with an increased likelihood of health and pension coverage. An increase in job tenure from 5 to 15 years, for instance, is associated with an increase of .135 (.297) in the absolute probability of health (pension) benefits. A $5 increase in the hourly wage is associated with an absolute increase of .120 in the probabilities of both health and pension benefits.

Sharp drops in the probability of receiving benefits are encountered by part-time workers. The estimated decline in the absolute likelihood of health (pension) benefits is .311 (.274). Given the large differences noted earlier in the comparisons of means, being female has a surprisingly modest negative impact, -.064 for health insurance and -.069 for pensions. Evidently, controlling for job tenure, part-time status, wage, industry, and occupation accounts for much of the difference between men and women in the probability of receiving benefits.[7]

The absolute change in the likelihood of health and pension coverage is markedly higher in manufacturing (.206 and .259 in durable goods and .144 and .220 in nondurable goods) and transportation and public utilities (.117 and .118). In three industry groups—finance, insurance, and real estate; services (except private household); and public administration—there are modest increases in the probability of health benefits (.088, .031, and .077), but substantial increases in the probability of pension benefits (.172, .219, and .551). (The reference industry is private household workers and agriculture).

The estimated impacts of the occupational status and location variables can be briefly summarized. Occupational status has a much smaller estimated impact than industrial status. The largest change in the absolute probability of benefits is an increase of .123 in health insurance for managers and a .137 increase in pension coverage for clerical workers. (The reference occupation is service workers.) The location variables (regional and Standard Metropolitan Statistical Area dummies) have no systematic influence on the receipt of benefits. ☐

[3] The CPS sample is composed of a rotating group of addresses. A particular address is in the sample 4 consecutive months, out 8, and then in 4 more months. Each month, only those persons in rotation groups four and eight are asked the earnings questions. In the data file used in this analysis, responses to the earnings questions in the June CPS (for those in rotation groups three and seven in May) have

been added to the individual data records. This matching process roughly doubles the number of participants in the May supplement for whom earnings data are available.

[5] *Employee Benefits in Industry: A Pilot Survey*, Report 615 (Bureau of Labor Statistics, 1980).

[6] For a discussion of the logit framework, see Marc Nerlove and S. J. Press, *Univariate and Multivariate Log-Linear Logistic Models*, Report R-1306-EDA/NTH (Santa Monica, Calif., The Rand Corporation, 1973).

[7] If the wage variable is excluded from the set of explanatory variables, the estimated impact of being female on the probability of receiving benefits increases by roughly 50 percent. Changes in the estimated effects of other factors are much more modest; typically the increase (in absolute value terms) is about 10 percent.

Labor market rights of foreign-born workers

DAVID S. NORTH

The 1970 Census counted 9.6 million foreign-born persons in the United States, divided almost equally between naturalized citizens and aliens. That was surely an undercount, as the Census has the same troubles enumerating the foreign-born as it does native-born disadvantaged populations. The total number of foreign-born in the United States in 1980 was in the 16 to 18 million range. In addition to some 4 million or so newly arrived legal immigrants, we have also taken on hundreds of thousands of refugees, and perhaps as many as 4 million illegal immigrants in the last decade. A disproportionately large segment of the illegal immigrants are in the work force (which is not the case with the other foreign-born subpopulations), so the number of foreign-born in the labor market is significant.

For our purposes, we divide the foreign-born into six groups, each of which has its own mix of labor market rights:

Naturalized citizens have all of the labor market rights of citizens, with two statistically minor exceptions: they are barred from the Presidency and the Vice Presidency, and they must serve a waiting period after naturalization prior to election to the Congress.

Permanent resident aliens arrived here legally and may become naturalized citizens after the passage of time.

Class A refugees are those recognized as such by the Refugee Act of 1980, as amended. Most refugees currently in the United States are from Indochina, but there are others from Afghanistan, Ethiopia, Eastern Europe, Cuba, and Haiti.

Class B refugees may look like refugees to an observer, but in the eyes of the Immigration and Naturalization Service, they are here illegally, and are ultimately subject to deportation.

Nonimmigrants are aliens admitted to the United States legally and temporarily to perform a particular function (to be a diplomat, a tourist, or a foreign student).

Illegal immigrants have either arrived surreptitiously or have come into the country bearing legitimate documents which they subsequently abused (either by staying too long, or by working when they were not supposed to do so).

Permanent resident aliens, and Class A and Class B refugees may work anywhere they can find a job. Some classes of nonimmigrants may work only in designated segments of the labor market, but most are not allowed to work at all. Illegal immigrants are not, *per se*, barred from employment, but they are barred from physical presence in the United States. If they are apprehended, they are subject to deportation.

While permanent resident aliens and Class A and Class B refugees are free to seek any job they can find, they are generally not protected from employment discrimination. The Federal Government, all private sector employers, and sometimes State and local governments may legally refuse to hire, for example, an Ethiopian permanent resident alien on the grounds that they will hire no permanent resident aliens—but they would be violating Title VII of the Civil Rights Act of 1964 if the decision was based on nation of origin or skin color. As a matter of fact, it is very difficult for most Federal agencies to employ permanent resident aliens, and virtually impossible for them to hire either class of refugees. Even the refugee-serving units of the government, such as the Office of Refugee Resettlement, may hire refugees only after they have secured permanent resident alien status, and those appointments require special dispensation from Federal personnel authorities.[1] Private sector employers may refuse to hire permanent resident aliens if the action is not designed to hide a bias against would-be employees of a certain nation of origin. State governments are generally not allowed to discriminate against permanent resident aliens, but the State of New York carried a case to the Supreme Court, successfully arguing that only citizens should be members of the State police force.[2]

Nonimmigrants who work legally in the United States may do so only along the lines permitted by the visa they carry. For example, a Jamaican, who secured a visa to cut sugar cane in Florida may not legally

---

pump gas in the service station across the street from the cane field and a diplomat who leaves the service of his nation may not stay in the United States and work as a lawyer.[3]

While it is against the law for illegal aliens to work in the United States, their employers are required to provide them with all the protections demanded of other workers. Thus, an employer of illegal immigrants must meet the provisions of the Occupational Safety and Health Act and the Fair Labor Standards Act and, in every State but Vermont, employers are required by State legislation to provide workers' compensation protection (for injured workers). Similarly, an employer must pay social security taxes for all workers, legal or illegal.[4] These provisions tend, in a small way, to reduce the incentive for employers to hire illegal immigrants. □

North and Allen LeBel, *Manpower and Immigration Policies in the United States*, Special Report No. 20 (Washington, National Commission for Manpower Policy, 1978), pp. 77–83.

[2] *Foley v. Connelie*, 435 U.S. 291 (1978).

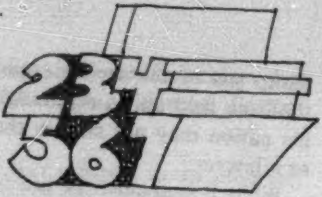
[3] The precise labor market rights of all the classes of nonimmigrants cannot be covered here; for more on this see Sam Bernsen, "Employment Rights of Aliens Under the Immigration Laws," *Interpreter Releases* 56: 240–55 (May 16, 1979); and David S. North, *Nonimmigrant Workers in the U.S.: Current Trends and Future Implications* (Washington, New TransCentury Foundation, 1980).

[4] Some legal, nonimmigrant workers are excluded by law from social security coverage, giving their employers, in a sense, a 6.7-percent discount on their wages. Temporary farm workers, foreign students and exchange visitors fall into this category.

A note on communications

The *Monthly Labor Review* welcomes communications that supplement, challenge, or expand on research published in its pages. To be considered for publication, communications should be factual and analytical, not polemical in tone. Communications should be addressed to the Editor-in-Chief, *Monthly Labor Review*, Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C. 20212.

The Anatomy of Price Change



Reconciling the CPI and the PCE Deflator: 4th quarter 1981

JULIE A. BUNN AND JACK E. TRIPLETT

The September 1981 issue of the *Monthly Labor Review*[1] presented a reconciliation of the Federal Government's two major inflation measures—the Consumer Price Index (CPI), published by the Bureau of Labor Statistics, and the Implicit Price Deflator for Personal Consumption Expenditures (PCE Deflator), produced by the Bureau of Economic Analysis. By comparing alternative versions of the indexes published by the Bureau of Labor Statistics and the Bureau of Economic Analysis, the difference between the CPI and PCE measures can be decomposed into three factors: owner-occupied housing, different index weights, and "all other" factors. The technical basis for the analysis is contained in the September 1981 article.[2]

This second quarterly update of the reconciliation, which extends the data through the end of calendar year 1981, shows a general narrowing of the difference between the two measures.

Reconciling period-to-period changes

Table 1 shows the reconciliation of percent changes in the Consumer Price Index for All Urban Consumers (CPI-U) and "PCE: Chain-Weight" index for the most recent years and quarters. These two indexes present alternative measures of period-to-period price change.[3]

The difference between CPI and PCE price measures, which widened with the upsurge of inflation in 1979, seems to be diminishing as inflation winds down. At 1.4 percentage points, the 1981 difference between the annual CPI and the PCE was half its value for 1980, and lower as well than the comparable number for 1979. The quarterly figures show a generally declining trend, although there is considerable variability. The difference for the fourth quarter of 1981 (0.3 percentage points) is the smallest quarterly difference in these alternative price measures in several years.

As demonstrated in the September article, the treatment of owner-occupied housing has historically been the largest source of PCE-CPI differences. The effect of alternative measures of owner-occupied housing can be estimated by comparing two BLS price indexes (CPI-U and CPI-X1) that are published monthly and measure housing in different ways.

In recent quarters, the "housing effect" has been smaller than it was in the first half of 1980. The negative entry for the fourth quarter of 1981 (−0.5 percentage points) occurred because the CPI-U, which follows the traditional BLS treatment of housing, advanced less than the CPI-X1 index, which approximates a "rental equivalence" measure of housing. (The BLS has announced plans to change the treatment of housing in the CPI-U index to incorporate a rental equivalence treatment, beginning in January 1983.[4])

Weighting differences are a second source of PCE-CPI differences. The CPI-U weights are drawn from an expenditure survey taken in 1972-73; weights for the PCE: Chain-Weight index are always taken from the period just preceding the date of publication (for example, weights for the 1981-IV index come from 1981-III), and so are more nearly current than are the CPI weights.

Table 1. 'Reconciliation' of annual, 1979–81, and quarterly, 1980–81, percent changes in the CPI-U and the Personal Consumption Expenditure price measures

Difference	1979	1980	1981	1980[1] [2]				1981[2]			
				I	II	III	IV	I	II	III	IV
CPI-U[3]	11.3	13.5	10.4	16.5	13.5	7.7	12.8	11.0	7.8	11.8	7.7
PCE: Chain-Weight[4]	9.3	10.6	9.0	12.5	9.7	9.5	10.1	10.3	6.5	8.7	7.4
Total difference[5] (CPI-U minus PCE: Chain-Weight)	2.0	2.9	1.4	4.0	3.8	−1.8	2.7	.7	1.3	3.1	.3
Housing treatment[6]	1.7	2.3	.9	3.6	3.4	−1.9	1.9	.4	.5	2.7	−.5
Weighting effect[7]	.3	.4	.1	.7	.2	.0	.0	.6	.0	−.5	−.2
"All other" effect[8]	.0	.2	.4	−.3	.2	.1	.8	−.3	.8	.9	1.0

[1] Owing to changes in seasonal adjustment factors, the quarterly figures may differ slightly from those which appeared in *Monthly Labor Review* Table 3, p. 9, September 1981 and Table 1, p. 43, January 1982.

[2] Seasonally adjusted annual rates.

[3] Annual and quarterly changes in the CPI-U are taken from tables provided by the Office of Prices and Living Conditions, Bureau of Labor Statistics. The changes are compiled from 1967 based indexes.

[4] Data for the "PCE: Chain-Weight" were obtained from the Bureau of Economic Analysis, U.S. Department of Commerce.

[5] CPI-U minus "PCE: Chain-Weight" equals the sum of "housing treatment", "weighting" and "all other" effects.

[6] Change in CPI-U minus change in CPI-XI. See September 1981 *Monthly Labor Review*, p. 21, for fuller explanation. Source of CPI-XI data is same as source in footnote 3.

[7] Change in "PCE: 1972-Weight" minus change in "PCE: Chain-Weight". See September 1981 *Monthly Labor Review*, pp. 8–9, for fuller explanation. Data source for "PCE: 1972-Weight" changes is same as for footnote 4.

[8] Change in CPI-XI minus change in "PCE: 1972-Weight". See September 1981 *Monthly Labor Review*, p. 6, for fuller explanation.

Julie A. Bunn is an economist in and Jack E. Triplett is assistant commissioner of the Office of Research and Evaluation, Bureau of Labor Statistics.

Table 2. 'Reconciliation' of the CPI-U and the Personal Consumption Expenditure price measures: cumulative percent change from 1972 to the date shown

Difference	1979	1980	1981	1980[1]				1981			
				I	II	III	IV	I	II	III	IV
CPI-U (1972=100)[2]	173.6	197.0	217.4	189.1	195.2	198.9	204.9	210.3	214.3	220.4	224.6
PCE: Deflator (1972=100)[3] (Current-Weight)	166.6	178.9	193.8	172.9	177.0	180.7	184.9	188.5	191.5	195.7	199.4
Total difference[4] (CPI-U minus PCE Deflator)	11.6	18.1	23.6	16.2	18.2	18.2	20.0	21.6	22.8	24.7	25.2
Housing treatment[5]	7.0	11.7	14.5	10.5	12.2	11.6	12.7	13.3	13.7	15.4	15.5
Weighting effect[6]	3.7	5.4	7.2	4.9	5.1	5.6	5.9	7.3	7.4	7.2	7.0
"All other" effect[7]	.9	1.0	1.9	.8	.9	1.0	1.4	1.2	1.7	2.1	2.7

[1] Owing to changes in seasonal adjustment factors, quarterly figures may differ slightly from those which appeared in *Monthly Labor Review* Table 4, p. 10, September 1981 and Table 2, p. 44, January 1982.

[2] Annual data for the CPI-U were computed by the Office of Research and Evaluation from unadjusted monthly data provided by the Office of Prices and Living Conditions, Bureau of Labor Statistics. The quarterly data for 1980 and 1981 were computed by the Office of Research and Evaluation employing seasonally adjusted monthly data provided by the Office of Prices and Living Conditions.

[3] Data for the implicit PCE Deflator, or "PCE: Current-Weight" index, were provided by the Bureau of Economic Analysis, U.S. Department of Commerce. The data incorporate revisions released in April 1981.

[4] CPI-U minus PCE Deflator equals the sum of "housing treatment", "weighting" and "all other" effects.

[5] CPI-U minus CPI-XI. See September 1981 *Monthly Labor Review*, p. 5, for fuller explanation. Data source for the CPI-XI is the same as footnote 2.

[6] "PCE: 1972-Weight" minus "PCE: Current-Weight". See September 1981 *Monthly Labor Review*, p. 6, for fuller explanation. Data source for the "PCE: 1972-Weight" is same as footnote 3.

[7] CPI-XI minus "PCE: 1972-Weight". See September 1981 *Monthly Labor Review*, p. 6, for fuller explanation.

As pointed out in the September 1981 article, the effect of utilizing different weights on disparities between the measures is far smaller than has often been supposed. Since mid-1980, weighting effects have essentially been zero, although there was more impact from this source in 1979 and early 1980. Negative values for weighting effects in the two most recent quarters reflect the fact that the index with the most recent weights (the PCE: Chain-Weight) has been rising somewhat *more* rapidly than an index based on the same price data but using 1972 weights.[5] It is usually expected that use of more recent weights will result in an index that rises *less* rapidly; as table 1 shows, this expectation is not always borne out.

The "all other" effect measures the influence of computational and compilation factors on the difference between the CPI and PCE measures (everything other than the period for which the weights were drawn, and the treatment of owner-occupied housing). The precise sources of the "all other" effect have not been quantified, but seasonal adjustment methods undoubtedly are important. PCE seasonal adjustment factors for 1981 and 1980 have not yet been re-estimated, while the CPI seasonals are revised annually; this has probably contributed to the increased magnitude of the "all other" effect in the quarterly numbers, an explanation that is consistent with the annual figure for 1981 (0.4) being so much lower than the quarterly figures.

Reconciling cumulative changes

For technical reasons, two reconciliations are necessary.[6] The first reconciliation, covered in the previous section, addresses the question: "What are the reasons the CPI and PCE price measures show different rates of change from one period to the next?" The reconciliation of the differences between the measures in this section answers the question: "What accounts for the cumulative divergence in the CPI and PCE since 1972?"

Table 2 reconciles the CPI-U and the Implicit Price Deflator for Personal Consumption Expenditures (PCE: Current-Weight) with 1972 as the base year. By the fourth quarter of 1981, the PCE: Current-Weight index indicated that consumption prices had almost doubled since 1972 (a 99-percent increase); by the CPI-U measure, the increase was nearly 125 percent. Of the approximately 25-percentage-point difference between the two, housing treatment accounted for three-fifths (15.5 percentage points). The table also shows that choosing current period weights instead of 1972 weights creates a difference of 7 percentage points, over a period when prices have doubled, by either alternative measure. The weighting effect has declined slightly in the most recent two quarters from its high reached early last year.

BOTH RECONCILIATIONS SUGGEST that the inflation rates recorded by CPI and PCE price measures may be converging. Quarterly and annual percentage increases in the two price measures differ less in 1981 than in the previous 2 years, and the cumulative reconciliation shows a similar picture. ☐

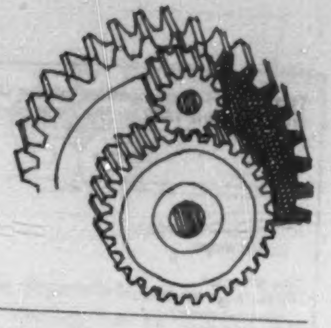
Productivity Reports



Productivity declined in 1980 in most industries measured

Arthur S. Herman

Productivity, as measured by output per employee hour, declined in 1980 in more than half of the industries for which the Bureau of Labor Statistics regularly publishes data. Although a number of important industries, such as coal mining, petroleum refining, and major household appliances registered significant gains, the productivity falloff in most industries was consistent with the situation in the nonfarm business sector as a whole, which had a 0.3-percent decline in 1980.

Table 1 shows productivity trends for the industries currently measured by the Bureau and includes new measures for the transformer, machine tools (including separate measures for metal cutting and metal forming machine tools), and nonwool yarn mill industries.[1] Data for 1980 are preliminary. The table also includes, for the first time, a series for the hardwood veneer and plywood industry, and the softwood veneer and plywood industry. These measures were developed by disaggregating the existing measure for veneer and plywood. Many of the measures have been revised back to 1972, due to the introduction of more current data. The labor input series for the mining industries have been revised to include nonproduction worker hours. Therefore, the mining productivity series now refer to output per employee hour rather than output per production worker hour, as previously published.

Changes by industry

Manufacturing. The motor vehicles industry, one of the more economically significant industries covered, had a large productivity decline of 4.4 percent in 1980. Output plummeted 28.2 percent as demand was off sharply for passenger cars, trucks, truck trailers, and buses. Employee hours were reduced drastically, down 24.9 percent. Productivity also declined in 1979, dropping 1.2 percent as both output and hours fell, but less sharply than in 1980. In steel manufacturing, another important industry, productivity declined 3.7 percent in 1980, after falling 1.3 percent in 1979. Output in this industry declined significantly, down 17.0 percent, because of a decrease in demand from such key markets as motor vehicles, construction, and appliances, while hours were reduced 13.8 percent.

Among other large manufacturing industries, a major productivity decline of 13.2 percent occurred in the construction machinery industry as output dropped 19.7 percent due to poor conditions throughout the construction industry. Productivity in the gray iron foundry industry declined 6.0 percent as output dropped a steep 21.7 percent. Productivity declines associated with large output reductions occurred in the measures for motors and generators (–4.1 percent), household furniture (–2.2 percent), and sawmills (–1.9 percent). Output fell more than 10 percent in 1980 in these three industries.

However, a number of manufacturing industries experienced productivity gains in 1980. But for many, the productivity increases reflected declines in output associated with even greater reductions in hours. In the fluid milk industry, for example, productivity grew 5.7 percent as output fell 0.1 percent and hours dropped 5.5 percent. Productivity increased 4.9 percent in the household appliance industry as output declined 6.8 percent and hours fell 11.1 percent. The petroleum refining industry had a productivity gain of 4.4 percent with output down 6.4 percent and hours dropping 10.3 percent.

Mining. Productivity in coal mining increased 12.6 percent in 1980, after falling in almost every year in the past decade. Coal output grew 6.4 percent owing to increased demand as a petroleum substitute, growing exports and stockpiling in anticipation of a strike in 1981, while hours fell 5.5 percent. However, productivity declines occurred in the other mining industries covered, with copper mining (recoverable metal) dropping 7.4 percent, nonmetallic minerals down 5.8 percent, and iron mining (usable ore) declining 0.2 percent.

Transportation and utilities. Productivity changes were mixed in transportation and utility industries. A

Arthur S. Herman is an economist in the Office of Productivity and Technology, Bureau of Labor Statistics.

[1] As defined in the *1972 Standard Industrial Classification Manual* published by the Office of Management and Budget.

[2] Preliminary.

[3] Not available.

[4] Percent change 1975–79.

[5] Rate of change is less than 0.05 percent.

[6] Output per employee.

[7] Output per hour of all persons.

NOTE: Although the output per employee hour measures relate output to the hours of all employees engaged in each industry, they do not measure the specific contribution of labor, capital, or any other single factor of production. Rather, they reflect the joint effects of many influences, including new technology, capital investment, the level of output, capacity utilization, energy use, and managerial skills, as well as the skills and efforts of the work force. Some of these measures use a labor input series that is based on hours paid and some use a labor input series that is based on plant hours. Because of revisions in source data and rebasing to 1977 = 100, a number of the measures published in this table differ from those previously published.

10.1-percent decline occurred in the petroleum pipeline industry as output decreased because of reduced demand for petroleum products. Productivity dropped 6.1 percent in air transportation, the first productivity decline since the measure began in 1947, as output fell. Productivity in intercity trucking fell 4.5 percent, the fourth consecutive decline, as output dropped 9.7 percent due to decreased shipments of consumer products, construction materials, and petroleum. Conversely, the two transportation industries that posted gains were bus carriers (3.3 percent) and railroads (revenue traffic, 2.5 percent). Electric and gas utilities had a productivity decline of 2.2 percent, based on a small increase in output and a larger gain in hours. Telephone communications, however, had a productivity gain of 6.6 percent, associated with a large gain in output.

Trade and services. Productivity changes also varied among trade and service industries. Productivity declined in hotels and motels (–7.7 percent), laundries and dry cleaning (–6.8 percent), gasoline stations (–3.5 percent), and eating and drinking places (–2.0 percent). Output fell in all of these industries. Conversely, productivity in drugstores rose 6.9 percent as output was up. New car dealers had a productivity gain of 4.4 percent, based on a sharp drop in output and an even steeper drop in hours. Retail food stores posted a small productivity gain of 0.2 percent, as output was up 2.6 percent.

Trends, 1975–80

While all of the measured industries registered gains over the long term (generally 1947–80 or 1958–80),[2] a significant number of industries had declining productivity over the more recent 5-year period, 1975–80. More than three-quarters of the industries recorded lower productivity during this period than in the preceding long term period (1947–75 or 1958–75.) This

ydown was consistent with the trends in the non-
n business sector of the economy where productivity
v 0.6 [ercent from 1975–80, compared with 2.4 per-
from 1947–75.

ns. In recent years, the wet corn milling industry
wed the highest rate of gain among the measured in-
tries. Productivity grew 10.6 percent during 1975–79
30 data were not yet available). The productivity ad-
ce in this industry was aided by a high rate of out-
growth (9.2 percent) as strong demand for high
tose syrup, one of the industry's key products, con-
ed. During this period, a number of new plants
e opened and a significant amount of highly auto-
ic manufacturing equipment came on line. The sec-
highest rate of productivity growth was for ceramic
l and floor tile (1975–79 rate of 7.5 percent). A new
nique for firing tile which became widespread in the
ustry, coupled with changes in materials handling,
lted in significant labor savings.

ther industries with current, high rates of growth
e telephone communications (6.5 percent), synthetic
rs (6.1 percent), and fluid milk (5.3 percent). In the
phone industry, high output growth was sustained
r 1975–80 (9.8 percent a year) and productivity was
d by expanded use of electronic switching equip-
t. In synthetic fibers, a highly capital intensive industry, output averaged 4.8 percent while hours were down 1.1 percent, resulting in the productivity gain. In the fluid milk industry, output was up at a low rate of 0.5 percent, while hours dropped at a rate of 4.5 percent. New, larger plants utilizing highly automatic computerized processing came on line during this period, while a number of smaller, less efficient milk plants were closed.

Declines. The flour industry had the largest average falloff in productivity, dropping 5.0 percent from 1975 to 1979. Output declined at an average rate of 2.2 percent while hours grew at a rate of 2.9 percent. Other industries with significant declines over 1975–80 were brick and structural clay tile (–3.7 percent), steel foundries (–2.1 percent), metal forming machine tools (–1.8 percent), and laundries (–1.7 percent). Twelve other industries recorded declining rates over the 1975–80 period, including such large industries as eating and drinking places (–1.4 percent), retail food stores (–1.2 percent), gray iron foundries (–0.8 percent), as well as gas and electric utilities and intercity trucking (both –0.1 percent).

s," November 1981, pp. 35–39; and James D. York, "Nonwool yarn mills experience slow gains in productivity," March 1982, pp. 30–33.

[2] About half of the data were collected beginning in 1947 and the remainder was collected from 1958 to present.

Technical Note

Estimation procedures for the Employment Cost Index

G. DONALD WOOD, JR.

The quarterly Employment Cost Index (ECI),[1] which includes measures of change in wages and salaries and in compensation (wages and salaries plus the employer cost of employee benefits), is estimated using the standard Laspeyres index formula. The general survey sample was specially designed to permit the construction of these standard indexes.

Indexes of wages and salaries are also available for union status and location categories. It is not possible to estimate standard Laspeyres indexes for these categories, because union status and location were not included in the basic sample design. However, information on these characteristics is collected from the sample establishments, and may be combined with data on wages and salaries to estimate quarter-to-quarter changes. The quarterly changes can then be used to derive special indexes by union status and location.

These special indexes have many of the properties of Laspeyres chain indexes. For example, each quarter the fixed-base-period-employment weight for each occupation by industry defined in the ECI sample design is apportioned between union and nonunion sectors. The current distribution of the work force in that occupation and industry, as reflected in the current sample, is the basis for the appropriation. The weights are used to compute quarterly changes in wages and salaries for the union and nonunion series. These changes are then multiplied together (chained) to estimate an index. Indexes derived in this fashion—special indexes—will be discussed in more detail after derivation of the standard indexes is described.

The ECI index of wages

The standard formula for the wage index is:

$$(1) \qquad I_t = \frac{\sum_i W_{it} E_{ib}}{\sum_i W_{i0} E_{ib}} \times 100$$

W_{i0} is the wage rate for the *i*th type labor in the reference period *0*—June 1981. (Labor of type *i* is defined in terms of an occupation within an industry.) W_{it} is the wage rate for the *i*th type labor in the current period *t*, and E_{ib} is employment of the *i*th type labor in the base period *b*, 1970.

In actual practice, the formula becomes:

$$(2) \qquad I_t = \frac{\sum_i CW_{it}}{\sum_i CW_{i0}} \times 100$$

where:

$CW_{i0} = \overline{W}_{i0} E_{ib}$ = The cost weight of the *i*th type labor at time *0*;

$CW_{it} = \overline{W}_{it} E_{ib}$ = The cost weight of the *i*th type labor at time *t*;

$\overline{W}_{i0}$ = The average wage at time *0*, estimated from the sample observations;

$\overline{W}_{it} = r_{it} (W_{i_{(t-1)}})$ = The average wage at time *t*;

r_{it} = The estimated relative change in wages between time *t-1* and time *t*. It is the estimate of the ratio of the wage rate at time *t* to the wage rate at time *t-1*. The estimate is based on matched wages—that is, wages for specific occupations and establishments that provide data for both periods.

The compensation index

The calculation of the ECI index of compensation is similar to that described above for wages. For the reference period *0*, a cost weight for wages (CW_{i0}) is calculated as described above. In addition, a cost weight for benefits (CB_{i0}) is calculated by multiplying the average cost of benefits per hour worked times employment in 1970:

$CB_{i0} = \overline{B}_{i0} (E_{ib})$ = The cost weight for benefits in the reference period *0*.

where $\overline{B}_{i0}$ is the average cost of benefits per hour worked for the *i*th type labor in period *0*.

G. Donald Wood, Jr. is Chief of the Division of Employment Cost Trends, Bureau of Labor Statistics.

The benefit cost weight in period *t-1* is multiplied by the estimated change in benefit cost ($r^{B}_{i(t)}$) between times *t-1* and *t* to get the next quarter's cost weight (CB_{it}):

$$(3) \qquad CB_{it} = r^{B}_{i(t)}\, CB_{i(t-1)}$$

The compensation index at time *t* is formed by summing the wage and the benefit cost weights at time *t*, dividing by the sum of the wage and benefit cost weights for the reference period *0*, and multiplying by 100.

Calculation of component indexes

As noted, the ECI is a system of indexes. In addition to the indexes of wages and compensation for the private civilian economy, there are indexes for State and local governments, and for the private nonfarm economy. For each of the chief economic sectors, there are subindexes for both wages and compensation by industry and occupation. At this time, more industry and occupation indexes of wages than of compensation meet publication standards.

The standard subindexes of the ECI are estimated using the formulas given above. All that is necessary is to limit the summation to the groups of labor included in the component series. This is possible because a Laspeyres index can always be expressed as a weighted sum of any set of component indexes. Thus, the overall index *I* at time *t* may be expressed as:

$$(4) \qquad I_t = \sum_{k} I^{k}_{t}\, (RI)^{k}_{0}$$

where its subindexes (I^k) are defined by:

$$(5) \qquad I^{k}_{t} = \frac{\sum_{i \epsilon k} \overline{W}_{it} E_{ib}}{\sum_{i \epsilon k} \overline{W}_{i0} E_{ib}}$$

and the weights used to aggregate them to the total are called relative importances $(RI)^{k}_{0}$, defined by:

$$(6) \qquad (RI)^{k}_{0} = \frac{\sum_{i \epsilon k} W_{i0} E_{ib}}{\sum_{k} \sum_{i \epsilon k} W_{i0} E_{ib}}, \text{ and } \sum_{k} (RI)^{k}_{0} = 1$$

Special wage indexes

The indexes by union, metropolitan area, and region use a different estimation formula. The reason for the difference deserves attention.

The national ECI measures the change in the cost of fixed labor inputs where units of labor input are defined by an occupation in an industry, for example, operatives except transport in the textile mill products industry. For the aggregate index, no distinction is made between union and nonunion labor. For instance, if weavers performing a specific job in a textile mill were selected to represent operatives in the textile industry, the change in their wage rate between quarters would be used in calculating the quarterly relative for all series that included this type of labor. No change in the computation procedure would be made if the workers in the mill became union members. Both before and after the workers were organized, the change in the wage rate would represent operatives in the textile industry.

But for the union and nonunion series, it is desirable to take account of changes in the union status of workers. Using the example above, before the weavers are organized, they are included as nonunion textile operatives in the wage index for nonunion workers. After they are organized, they should be included in the union index for textile operatives.

Because such categorical shifts cannot be accommodated with a fixed-weight index, the union-status and other special indexes are derived in such a way that they are like chain indexes. The relative importance of the union and nonunion components of the *i*th type of labor (that is, an occupation within an industry) is allowed to vary over time as the sample changes. The union and other special indexes are derived by compounding successive quarter-to-quarter relatives (that is, percentage changes expressed as ratios) and multiplying by 100, rather than by comparing a current-quarter cost weight to some base-period cost weight. This procedure is followed because any base-period cost weight might, for example, reflect a different employment distribution between union and nonunion than prevails currently. These special indexes differ from the usual chain index, however, in that total employment, union plus nonunion, for each type of labor is held fixed at the 1970 level. The union relative, R^u, has the form:

$$(7) \qquad R^{u}_{t} = \frac{\sum_{i} \overline{W}^{u}_{it} \dfrac{E^{u}_{i(t-1)}}{E_{i(t-1)}} E_{ib}}{\sum_{i} \overline{W}^{u}_{i(t-1)} \dfrac{E^{u}_{i(t-1)}}{E_{i(t-1)}} E_{ib}}$$

where:

$\overline{W}^{u}_{it}$ = Wage of union labor of type *i* in time *t*;

$E^{u}_{i(t-1)}$ = Employment of union labor of type *i* in time *t-1*;

$E_{i(t-1)}$ = Employment of union and nonunion labor of type *i* in time *t-1*.

The index, I^u, is the product of the relatives times 100:

$$I^{u}_{t} = R^{u}_{t} \times R^{u}_{(t-1)} \ldots R^{u}_{1} \times 100$$

The proportion of total employment represented by union labor at time *t* for the comparison between times *t-1* and *t* is based on the sample of matched quotes used in the estimation of the aggregate index. But note that the union wage in time *t-1* is not estimated directly from the sample observations. Rather, the matched sample is used to estimate the union wage rate for the *i*th type of labor relative to the wage of all labor of the *i*th type. This estimated relative is multiplied by the estimated average wage for all types of labor used in the aggregate index, as indicated by:[2]

$$(8) \qquad \overline{W}^{u}_{i(t-1)} = \overline{W}_{i(t-1)} \left(\frac{W^{u}_{i(t-1)}}{W_{i(t-1)}} \right)_{av}$$

The union wage rate at time *t* is estimated as:

$$(9) \qquad \overline{W}^{u}_{it} = r^{u}_{it} \, \overline{W}^{u}_{i(t-1)}$$

where r^{u}_{it} is the wage relative of union labor of type *i* based on matched quotes between time *t-1* and *t*.

Indexes before June 1981

All standard and special index values since June 1981 have been estimated using the equations described above. But before June 1981, only quarterly relatives for each series were calculated. Because index numbers were not being constructed at that time, there was no need to compare the current quarter cost weights to the reference period cost weights. Instead, the wages or compensation based on matched quotes were directly multiplied by 1970 employment.

For this reason, the indexes for periods before June 1981 have been estimated by dividing the index (*I*) for June 1981 by the product of previously derived quarterly change relatives (*R*). That is:

$$(10a) \qquad I_{\text{March 1981}} = I_{\text{June 1981}} \,/\, R_{\text{June 1981}}$$

$$(10b) \qquad I_{\text{December 1980}} = I_{\text{June 1981}} \,/ (R_{\text{June 1981}}) \, (R_{\text{March 1981}})$$

and so forth. □

FOOTNOTES

[2] In fact, the system does not explicitly compute all of the estimates described, but uses a simplified computational procedure which yields the same final estimates.

Foreign Labor Developments

Solidarity's proposals for reforming Poland's economy

HORST BRAND

Worker opposition in Eastern Europe is not a new phenomenon. Recall East Germany in 1953, Hungary in 1956, Poland in 1956 and subsequent years, and Czechoslovakia in 1968. Industrial unrest of more limited scope has occurred in Rumania and, according to Roy Medvedev,[1] in the Soviet Union. But in all of these countries, the revolts were short-lived, being quickly suppressed by the armed forces; thus, the political tendencies they might have spawned given time could not bear fruit. In Poland, by contrast, the broad-based workers' movement had the opportunity to mature to a much more advanced stage, characterized by Solidarity, an autonomous movement which superseded the established state-sponsored trade unions.

With the emergence of Solidarity, the workers left behind the more limited strike and protest actions of the early and mid-1970's which had had some favorable effects on the government's price, wage, and production policies, but made little lasting impact. Solidarity emerged from the inter-enterprise strike committee formed in August 1980 at Gdansk and Szczecin. Some of the committee's demands were unprecedented and audacious. It wanted free unions, in accordance with the 87th convention of the International Labour Organization, which had been ratified by Poland; the right to strike, and safety for strike participants and their helpers; freedom of speech, as guaranteed by the Polish constitution; restoration of jobs to employees dismissed for participating in earlier strike actions; liberation of all political prisoners; full publicity for Solidarity; the appointment of managers on the basis of competence; the abolition of privileges for the party apparatus, the police, and the internal security police; and a number of improvements in economic and social services.[2]

Solidarity lent form, structure, and articulateness to worker protest. By force of circumstance, it evolved into an opposition party, breaking the monopoly of the Polish United Workers Party.[3] (Solidarity explicitly recognized that party's "leading role," although this recognition came increasingly under attack from groups within the organization.) Among the tasks Solidarity faced was to formulate alternatives to the government policies and institutions that had led Poland to the brink of economic ruin. Here, another development which had gathered momentum since the mid-1970's became pertinent: some dissident Polish intellectuals, among them noted scholars and experts in economics, history, and other social sciences, either supported Solidarity or generated a climate in which ideas for reforming the Polish polity could flourish. Examples of this support included KOR (Committee for Worker Defense), established in 1976 to free workers from jail; the Experience and Future group, more inclined than KOR to reform the system "from within"; and the Flying University. Some members of these groups became key advisers to Solidarity during the crucial Gdansk negotiations in 1980.

Following is a discussion of some of Solidarity's goals and policies formulated and issued at its October 1981 convention. The discussion is based essentially on two documents which contain the basic thinking of Solidarity: *Position on Social and Economic Reform of the Country*, issued by the Network of Solidarity Organizations in Leading Factories, and *Programs of the Independent Self-Governing Trade Union Solidarity Adopted by the First National Congress of Delegations*, the Solidarity Congress' program resolution.[4] Solidarity's proposals can be divided into those involving (1) civil liberties and the rule of law; (2) the self-managed enterprise and its relation to the economy; and (3) the improvement of current economic conditions. Only the proposals dealing with self-managed enterprises are discussed in detail in this report.

Autonomous enterprise favored

Solidarity favors the creation of several types of enterprise—"social," state, cooperative, private, and mixed. The social enterprise was to be "the basic element of the national economy [with] full independence,

---

autonomy of its workforce, and . . . self-financing." In contrast, state enterprises were to be created "only in exceptional cases, inspired by national interest . . . verified by Parliament." Like the social enterprise, the state enterprise was to be controlled by means of "economic instruments" and had to be self-financing.[5]

Self-financing was conceived to be a condition *sine qua non* of the self-managed enterprise. Self-financing would free enterprises from control of the government; it would be an incentive for efficiency, penalizing the inefficient enterprise. To encourage long-term investment, certain modifications to monetary policy would be necessary, for instance, low-interest loans and compulsory reserve funds. But, the principle of self-finance should be "unconditionally observed," and accordingly, the granting of bank credit should no longer be automatic.

The self-managed enterprise, as conceived by Solidarity, does not resemble in either form or structure the entrepreneurial firm in Western countries. There are fundamental differences in legal status. The self-managed enterprise would be run by its employees and their elected representatives, or an employees' council. The enterprise managers would be appointed by the employees' council, be "subservient" to it, and would be obliged to carry out the council's resolutions. Such subservience was intended not merely to ensure the democratic control of the enterprise, but also to sever the link between enterprise management, on the one hand, and the central administration and party hierarchy, on the other.

The function of an employees' council is not comparable to that of a board of directors in Western countries. The directors' authority is usually nominal and they often have interests in firms other than the one on whose board they sit. The employees' council would determine the direction of the enterprises' development and operation, labor and training policies, the division of profits, and the extent of cooperation with other enterprises and of foreign trade, for example. Profits would indeed "become the main stimulus of economic activity of an enterprise," and the amount of wages above a certain fixed floor would be determined by profits. However, profits could not be derived from monopoly practices, and enterprises would be monitored by a state agency to prevent such practices—to be specified by law—and sanctions would be imposed on violators. Solidarity did not define "profits," and it is not clear whether profits can be generated under the proposed conditions, which include the regulation of prices by the market, bolstered by competitive imports. The advocacy of the market as price regulator (with a few exceptions) was not a matter of ideology. It emerged from experience with Poland's system of rigid prices, which had stymied increases in supplies and, more important, had contributed to fostering bureaucracy.

Decentralization—a major concern

If there is one notion that pervades Solidarity's thinking as reflected in its program, it is decentralization: "The basic principle underlying economic reform is to provide safeguards for independence, self-management, and self-financing of enterprises, which implies the abolishment of the directive-allocative system and the structures associated with it."[6] The dismantling of the "directive-allocative system" would mean the demise of a vast state bureaucracy, as well as of the patronage base of the ruling party. There would still be a Council of Ministers, whose responsibilities would include formulating economic policies, and to which a staff of economic planners would report. But the state would no longer have ultimate authority; that authority would be transferred to the Sejm—the Polish parliament—which would have its own economic planning staff to avoid a "central planning monopoly." Furthermore, the planning authority of the Council of Ministers would not be inherent but delegated by the Sejm, for according to Solidarity's thinking, "socialized planning should be operated on the principle that the final decision belongs to representative, not executive bodies."[7]

The importance of central planning would be drastically reduced under Solidarity's proposals. Its scope would be restricted to the "indispensable, leaving the remainder to the self-controlling mechanisms" because experience has taught "that planning covering all spheres of social and economic life becomes the way and method for developing a totalitarian system that attempts to predict and control everything."[8] The central plan "is merely a plan for the government"[9] and it must not impose decisions on enterprises and regional entities, whose planning is to be "autonomous." Underlying the conception of autonomous planning is the assumption that the enterprise, being subject to various market and social forces, will always plan so as to improve its operations. Yet, such efforts must surely give rise to imbalances, and it is the task of central planning to deal with these imbalances, that is, "to determine basic dynamics and structural proportions," including the allocation of new capital investment.

Solidarity viewed the central administrative system that dominates the Polish economy as shackling the natural energies and competence of the Polish work force. It declared that the "essential matter" is to eliminate "the dictative and distributional mechanism of management, consisting, on the one hand, in establishing tasks and, on the other, establishing means or limits of expenditures . . . [This] mechanism is responsible for decrease in economic effectiveness, lack of balance, negative social effects (falsification of information, bureaucratization, disappearance of self-management)."[10]

But what would replace the central administrative system? Some of Solidarity's pertinent proposals include: direct, legally protected contract relations between suppliers and customers to replace directed distribution; self-financing of enterprises, regulated by taxation and credit, to supersede centrally controlled funding (the supervision of enterprise finances would be confined to ensuring conformance to law); and job assignments, plant layout, establishment of work norms and wage rates, and similar matters set by the self-managed enterprise, not the Ministry of Labor and Wages which no longer would oversee the enterprise staff (this task would fall to specialized institutions, themselves self-managed, which would render purely advisory and training services).

How, in Solidarity's conception, would central planning be implemented? Recall that Solidarity demanded that all administrative bodies charged with resource allocation be eliminated; that economic enterprises plan autonomously; that no administrative links exist between the planning authorities (at the top there would be at least two of them) and enterprises; and that the state budget be the only financial plan of the state.

The key to the answer is Solidarity's proposal that "instruments incoherent with the logic of economic market relations should be replaced by instruments operating via income and demand basis."[11] One infers from this viewpoint that the instruments consist largely of taxation and credit. Taxation is a policy instrument, in addition to financing the state budget, " . . . [The] taxes included in the liabilities of an enterprise would regulate the total financial balance in the economy, and also regulate the amount and distribution of income into production and consumption funds."[12] Taxes on enterprise income, furthermore, would be graduated to regulate increases in profits. Taxes on the enterprise's wage expenditures would be assessed so as to eliminate excessive differences in personal incomes between groups of employees.

Credit policy would function as it is designed to function in Western countries, that is, to protect the purchasing power of money and help stabilize the economy. The question of credit policy is much more complex than Solidarity's proposals suggest. Controls over foreign capital investments, for example, are not mentioned in its discussion of credit policy. Also the problem of rampant inflation in the current administered-price system is not satisfactorily discussed. Institutional reforms evidently take precedence over current policy problems. The banking system would be autonomous (although accountable to parliament, as it is not, or to only a tenuous degree, in the United States or in Great Britain). The banking system would cease to be accountable to the Ministry of Finance and, thus, could no longer be used to control enterprise funds. Enterprises would be free to avail themselves of credit, subject only to criteria of solvency and interest rates.

Abolishment of privileges

Decentralization and the self-managed enterprise directed by a workers' council is one of the axes of Solidarity's program. The abolition of privilege and social inequality is the other. The term "axes" is used deliberately here, for it refers to a coordinate system in which efficiency and equality are not tradeoffs, but are indispensable to each other. That is the sense of Solidarity's program.

The extent of privilege and inequality in Poland has been summarized in the Experience and Future group's *Report on the State of the Republic*:[13]

> The seventies were a decade when incomes rose rapidly, albeit most rapidly in the highest income bracket, the end result being a widening of the income differential to a ratio of 1 : 20 . . . . Part of society continues to live with lower than the social minimum income, while another segment, consisting of the privileged, has incomes several or even dozens of times the average . . . . There exists in Poland a very large group of people who live in poverty, quite often near the subsistence level.
>
> The mere fact of belonging to the Polish United Workers' Party does not automatically yield benefits. Only members of the active political core of the Party, its allied political groupings, and the administrative apparatus enjoy a privileged position in society. Their privileges extend to almost all spheres of life: access to status positions, real incomes, easier shopping, health, education, and foreign travel . . . . During the 1970's, these privileges were extended to relatively large groups in society; the decade also witnessed the inheritance of privilege. These groups, which do not share the concerns of the majority, are more interested in supplementing existing privileges and acquiring new ones than they are in improving any aspect of public life."

This situation lay at the root of the rise of Solidarity as a social movement; its program manifests the urge to deal with it.

The abolition of privilege is implicit in the proposed economic reforms. Employees' councils could readily control the pay and other compensation of appointed managers. They could institute personnel policies based on competence and experience rather than party membership. The accountability of government executives to the Sejm could serve to control their emoluments. And the proposed abandonment of the system of allocation and directed distribution would likewise eliminate many jobs to which privileges attach. The abolition of privilege is inseparable from the creation of a more productive economy. "The union calls for reform. Its purpose is to abolish the privileges of the bureaucracy and to rule out the possibility of their restoration. The reform must bring about the general liberation of industriousness and enterprise."[14]

Cost to workers not defined

The reform implies "public costs," but does not define what these costs would include. There is a possibility that jobs and income would be lost and inefficient enterprises would close. No central authority would be established to cope with these problems. The idea of the state as a service state is not considered; it is left implicit at best and usually ignored. For example, Solidarity's program declares that "the Union will resist the growing differences among enterprises and regions." Appropriate tax measures can help do this, but it has been the experience in Western countries that central authority must actively intervene (for example, federally sponsored area redevelopment or some kind of urban aid), however ineffectual such intervention may be. Solidarity would assign this task mainly to territorial bodies, and it would be implemented chiefly by taking over the social welfare activities currently operated by enterprises. A national social fund would shift aid to needy regions. It is not clear (but appears doubtful) whether the central planning or banking authorities would have sufficient power to influence the flow of investment funds so as to compensate regional imbalances. The ambivalence on this and related points reflect Solidarity's profound distrust of the state as it has experienced it.

Such distrust is apparent in the area of employment as well. Solidarity advocated "the universal right to work," and opposed unemployment.[15] It opposed staff reduction unless "there are social guarantees [such as allowances and retraining,] for people who are temporarily jobless." It did not, however, explicitly obligate the state to ensure full employment, although it foresaw "public costs" for the reforms it demanded. Other than to propose that regional boards form special employment commissions, Solidarity did not assign specific job-creating responsibilities to the state. It may be that it feared the state would create "unproductive" jobs.

THE SUPPRESSION OF SOLIDARITY does not impair the significance of its program. On the contrary, the program articulated the threat Solidarity ultimately posed to the "New Class"[16] and to its monopolistic control over social property. The program corresponded to profound social needs which, of course, will persist and which, if postwar history is any guide, will reassert itself in political action. □

Research Summaries

Workers on long schedules, single and multiple jobholders

DANIEL E. TAYLOR AND EDWARD S. SEKSCENSKI

Although the "standard workweek" in the United States has been 40 hours for several decades, about 1 in every 4 workers labored 41 hours or more per week in May 1980. Workers on long schedules holding a single job totaled 21.3 million and those with two jobs or more, 3.2 million.

This report is concerned with that segment of the work force that works more than 40 hours per week, whether at one job or more. Data on multiple jobholders who worked less than 41 hours are also examined. The analysis consolidates data that previously appeared in two separate Bureau of Labor Statistics' reports. One report focused on extended workweeks of single jobs and the other on multiple jobholding. The information is from the May supplement to the Current Population Survey (CPS).[1]

The 40-hour workweek is widely accepted as the standard in labor law and collective bargaining agreements. In 1980, more than 56 million wage and salary workers, three-fifths of the total, were covered by provisions of the Fair Labor Standards Act (FLSA) that required premium wages for work in excess of 40 hours a week. Other laws covering workers in the Federal Government or in firms having Federal contracts contain premium pay provisions to discourage work in excess of 40 hours a week.[2] Forty hours is also the usual cutoff in major collective bargaining agreements that provide premium pay after a minimum number of weekly hours.[3]

A third of all employed men and more than 1 in 7 women in the work force exceeded the standard workweek in May 1980. (See table 1.) Full-time workers put in an average of 43.1 hours a week. One-third of both single and multiple jobholders who exceeded the 40-hour standard worked from 49 to 59 hours. However, a far higher proportion of single jobholders worked 41 to 48 hours than worked 60 hours or more, while the reverse was true for multiple jobholders, as shown in the following tabulation (numbers in thousands):

	Number at work	*Percent at work—*		
	41 hours or more	*41 to 48 hours*	*49 to 59 hours*	*60 hours or more*
Single jobholders	21,300	40	33	26
Men	16,600	37	34	29
Women	4,800	53	29	18
Multiple jobholders	3,200	27	34	39
Men	2,400	23	33	44
Women	800	37	36	27

For many workers, longer workweeks, whether on overtime or on second jobs, represent a tradeoff between income and leisure. It is not always the workers' choice, however, as evidenced by collective bargaining agreements that include provisions on the right to refuse overtime alongside provisions on the right to equal opportunity for overtime. Reasons for multiple jobholding include a variety of motivations in addition to increasing income such as gaining work experience, enjoyment of work, and helping a friend.[4]

Firms use overtime to overcome "disequilibrium conditions," such as a sudden increase in product demand, higher than usual worker absences, or other unanticipated events. Where premium wages cost less than recruiting, hiring, training, and fringe benefits for additional workers, overtime may be regularly scheduled.[5] A firm's demand for moonlighters, in contrast, usually represents a demand for part-time workers. Part-time employees are often relatively low-cost labor. Their wage rates tend to be below those of full-time workers and their fringe benefits fewer.

Single jobholders

About 16.6 million wage and salary workers were on extended schedules on their sole or primary job in May 1980; two-fifths of them received premium pay. Work-

Widowed or divorced	6,348	1,114	17.5	919	14.5	195	3.1

weeks of 41 hours or more were the usual routine for many workers—two-thirds of the workers on long hours in May 1980. Such workers are less likely to receive premium pay than those who worked more than 40 hours in the survey week but usually do not. This is probably because the latter group works more often on jobs that are not covered by the Fair Labor Standards Act or by collective bargaining provisions on overtime pay.

Between May 1973 and May 1980, the proportion of full-time wage and salary workers who reported long workweeks on a single job turned down slightly (table 2). Amendments to the Fair Labor Standards Act during the 1970's, which brought additional workers under its overtime provisions, primarily in the service and retail trade industries, played an important role in the trend.[6]

Extended workweeks and premium pay are sensitive to changes in economic conditions. During the recessions of 1974–75 and 1980, both the proportion of workers on long schedules and the prevalence of premium pay for those who exceeded the standard workweek showed significant declines. Manufacturing plays an important role in such cyclical patterns. For example, in May 1980, manufacturing industries accounted for about 40 percent of the decline in the number of workers on extended workweeks although they employed 22 percent of all workers.

Sex and age. Men are far more likely than women to put in long workweeks. In May 1980, men made up 77 percent of the employees who exceeded 40 hours on a single job and accounted for 62 percent of all full-time employees. Further underscoring the differences, the majority of men reported working more than 49 hours, while the majority of women worked 41 to 48 hours.

Married men are particularly prone to work extended weeks. In May 1980, 30 percent of married men but only 21 percent of single men exceeded the standard. Marital status had the reverse effect on women—those who were separated, divorced, or widowed were most likely to exceed the standard (table 3). Race had the same relationship to extended workweeks for men and women. White men and women were more likely than blacks to work 41 hours or more on a single job.

Overall, a higher proportion of women than men received a premium rate of pay for hours in excess of 40 per week (43 versus 40 percent). This relationship was reversed for blacks, with men far more likely to receive premium pay for extended workweeks.

Workers, aged 25 to 44 years, were slightly over-represented among employees who exceeded the standard workweek on a single job in May 1980. Teenagers, as might be expected, had relatively small proportions on long workweeks. In each of the four age groups that span the working-age population, men were two-and-a-half times as likely as women to work extended hours.

Union status. Workers covered by union contracts are less apt to work long schedules and more likely to receive premium pay for weeks in excess of the standard. In May 1980, 16 percent of the union workers and 26 percent of nonunion workers had such schedules. Among workers on long workweeks, 68 percent of those covered by union contracts received premium pay, compared to 33 percent of other workers. These differences are explained, in part, by organized labor's ability to gain overtime premium provisions in collective bargaining agreements and the greater likelihood that union members will be covered by the Fair Labor Standards Act. As a result, employers generally incur higher costs for employing union members beyond the standard workweek.

Occupation and industry. Professional and technical workers, managers and administrators, and craftworkers accounted for over 9 million of the employees who exceeded the standard workweek in May 1980, 55 percent of the total. Of these three groups, however, only managers were heavily overrepresented. Employees in this group made up 21 percent of all employees who exceeded the standard workweek, but only 12 percent of all full-time employees.

Other occupations that were overrepresented on extended workweeks included farmers, transport equipment operatives, and salesworkers. In contrast, clerical and service workers and factory operatives were underrepresented (table 4).

Table 2. Full-time wage and salary workers who worked 41 hours or more on a single job and those who received premium pay, May 1973 to May 1980

[Numbers in thousands]

Year	All full-time wage and salary workers	Worked 41 hours or more		Received premium pay	
		Number	Percent of full-time workers	Number	Percent of those who worked 41 hours or more
1973 ..	62,202	18,105	29.1	7,697	42.5
1974 ..	63,714	17,564	27.6	7,302	41.6

The inverse relationship that generally exists between the prevalence of extended hours and premium pay may be observed among occupations. To illustrate, nearly half of all full-time farmworkers had extended workweeks, but only one-tenth of these received premium pay. However, 18 percent of factory operatives reported working more than 40 hours, with 84 percent of them receiving premium pay.

Similar proportions of employees were on long workweeks in the goods-producing and service-producing sectors in May 1980—about 23 percent (table 5). Within the goods-producing sector, agriculture had the highest proportion (46 percent), followed by mining (38 percent). Within the service-producing sector, the proportion of full-time workers on extended schedules ranged from 31 percent in trade to 10 percent in State public administration.

Nearly twice as many workers in the goods-producing sector as in the service-producing sector received a premium rate of pay for work in excess of the standard in May 1980 (56 versus 31 percent). Again, coverage by the Fair Labor Standards Act and collective bargaining agreements is an important factor in this difference. In September 1980, FLSA provisions covered 81 percent of the employees in the goods-producing sector compared with 51 percent in the service-producing sector. In terms of union coverage, 34 percent of the full-time workers in the goods-producing sector, and 26 percent

Table 4. Full-time wage and salary workers who worked 41 hours or more a week on a single job and those who received premium pay, by occupational group, May 1980

[Numbers in thousands]

Occupation	1980		
	Worked 41 hours or more		
	Number	Percent of full-time workers	Percent who received premium pay
All occupations	16,600	23.1	40.4
Professional, technical and kindred workers	3,018	24.0	21.4
Managers and administrators, except farm	3,513	41.4	12.7
Salesworkers	1,106	31.6	13.5

NOTE: Because of rounding, sums of individual items may not equal totals.

in the service-producing sector were under collective bargaining agreements.

Multiple jobholders

In all, about 4.8 million persons, including both wage and salary workers and the self-employed, worked two jobs or more in May 1980. Their percentage distribution by hours on their primary job was similar to that of other jobholders, as shown below:

	Single jobholders	*Multiple jobholders*	
		Primary job	*All jobs*
Total	100	100	100
1–34 hours	25	30	15
35–40 hours	51	48	9
41 hours or more	24	22	76
Median weekly hours	40	40	51

As the tabulation shows, when hours on all jobs are cumulated, more than three-quarters of all dual jobholders worked beyond the standard workweek in May 1980. This represents 4 of every 5 men, and more than 2 of every 5 women, who held more than one job.

For all dual jobholders, combined median hours worked were slightly lower in 1980 than in 1979. The decrease resulted primarily from a drop of 2 hours (from 54 to 52) in the average workweeks of dual jobholding men. In addition, women—whose workweeks generally are shorter than those of men—increased their share of total dual jobholding from 30 to 33 percent, continuing a trend of at least a decade (table 6).

While total hours by dual jobholding women have been rising for several years, half of all women working two jobs continue to hold two part-time jobs. In contrast, more than three-fourths of the men who hold two jobs work one part-time and one full-time job. Another 6 percent of the men work two full-time jobs.

Table 5. Full-time wage and salary workers who worked 41 hours or more on a single job and those who received premium pay, by industry, May 1973 to 1980

[1] Multiple jobholders as a percent of all employed persons.

[2] Starting with 1977, data are for black workers only. Data for prior years are for persons of black and other races except white, about 90 percent of whom are black.

Married men continued to be the most likely workers to extend their workweeks on second jobs (table 7), although their dual jobholding rates declined from 7.8 to 6.2 percent between 1970 and 1980. In contrast, the rates for married women rose from 1.8 to 3.4 percent over the same period. Dual jobholding rates also increased for women who were divorced, separated, or widowed, from 3.0 to 4.6 percent.

Occupations of dual jobholders. Wage and salary workers whose primary jobs were in professional or technical occupations were most likely to hold more than one job. Workers in these occupations tend to have both highly marketable skills and relatively flexible work schedules. Nearly 1 in 12 professional or technical workers held a second job in May 1980. For half of them, the second job was in the same occupation as their first job.

Teachers below the college level were particularly likely to hold a second job. About 11 percent of all teachers, and nearly 1 in 5 men in this profession, were moonlighters. Workers in the protective services (police, guards, and firefighters) and farmworkers also had higher than average rates of dual jobholding in 1980 (9.6 and 6.4 percent).

Factory operatives and clerical workers were the least likely to hold second jobs. For factory operatives, the greater availability of premium pay for extended workweeks undoubtedly is a factor in their lower incidence of multiple jobholding. In the case of clerical workers, the relatively high proportion of women in the occupation tends to lower the proportion of those holding two jobs. The dual jobholding rate for clerical workers was 3.8 percent, the same as for all women.

Self-employment and multiple jobholding. Two-fifths of all dual jobholders were self-employed on one of their jobs.[7] About 7 percent held primary self-employed positions; 34 percent were self-employed, on a second job.

The proportion of dual jobholders who were self-employed on a second job in agriculture was much higher than that in the nonagricultural sector (table 8). One half of all dual jobholders whose primary jobs were in agriculture were self-employed compared to 1 in 20 whose self-employment was in a nonagricultural industry.

Median hours worked at a self-employed second job were 13 per week in 1980, the same as for wage and salary second jobs. The average of those self-employed in agricultural second jobs, however, was 16 hours per week, compared to 11 hours per week for those in nonagricultural self-employed jobs. About one dual jobholder in eight who was self-employed on a second job in agriculture worked full time on both jobs. This compares to only 1 in 20 second jobholders in the nonagricultural sector who held two full-time jobs.

Reasons for working a second job. About 2 of every 5 persons working two jobs reported they did so to meet regular expenses or pay off debts. Another fifth said they wanted to save for the future or buy something special with their extra earnings. There is evidence that some multiple jobholders work a second job in preparation for a career change. More than 8 percent of the men and 6 percent of the women reported working two jobs in order to gain the necessary experience to meet the skill requirements of the second job. Another 17 percent stated that enjoyment of their second job was the main reason for dual jobholding.

Black workers, especially women, were more likely than white workers to report economic reasons as their prime motivation for working more than one job. Almost one-half of the black men and three-fifths of black women reported meeting regular expenses or paying off

Table 7. Multiple jobholders by sex, age, marital status, race, and Hispanic origin, May 1980

Hispanic origin[1]	4,985	147	3.0	3,043	104	3.4	1,942	43	2.2

[1] Persons of Hispanic origin may be of any race; hence, their numbers are included in the data for whites and blacks.

debts as their main reason for dual jobholding. White men and women reported these reasons about 40 percent of the time.

Age has a different effect on the motivations of men and women for multiple jobholding. For men, economic incentives to work a second job increase with age through the 25- to 34-year-old group, then decrease. For women, there is no similar pattern. More than two-fifths of women multiple jobholders reported that they worked two jobs to meet regular expenses or pay off debts. In general, more older than younger workers, both men and women, reported that enjoyment of their second job was the reason for dual jobholding.

Marital status also has different effects on the motivations of men and women for working second jobs. Married men were more likely to report economic reasons than married women (41 versus 34 percent). Single, divorced, separated, and widowed women, however, were much more likely than men of similar status to work two jobs out of economic need (49 versus 30 percent).

Underground economy—hidden employment

It is not known to what extent the estimates of moonlighting understate the true level of multiple jobholding in the United States. Some underestimating may result from nonreporting of work in the "underground" or "hidden" economy in an effort to avoid the payment of taxes or to draw unemployment compensation while employed. However, a large part of the hidden economy may simply represent the production of goods and services in an informal manner. Louis A. Ferman and others provide some information on the

Table 8. Multiple jobholders by type of industry and class of worker, May 1980

[Numbers in thousands]

Primary job	Total employed	Multiple jobholders		Second job in agriculture			Second job in nonagriculture

Unpaid family	479	14	3.0	0	0	(2)	14	14	(2)

[1] Self-employed persons with secondary businesses or farms, but no wage or salary jobs, were not counted as multiple jobholders.

[2] Persons whose primary jobs were as unpaid family workers were counted as multiple jobholders only if they also held wage or salary jobs.

types of jobs and motivations of persons who work in the regular economy but moonlight in the hidden economy. They state that most of these moonlighters were "concerned primarily with meeting actual or perceived needs."[8] As to the extent of the hidden economy, estimates have ranged from 10 to 33 percent of the gross national product.[9]

Summary

Among all employed persons, men are far more likely than women to exceed the standard workweek. Women who work extended hours are slightly more likely than men to do so through multiple jobholding than on one job alone. Multiple jobs for women often consist of two part-time jobs, whereas men usually combine a full-time and a part-time job.

The occupational distribution of wage and salary workers on extended workweeks differs markedly between single and multiple jobholders. Managers and administrators who exceeded the standard workweek in May 1980 made up a far larger proportion of single than multiple jobholders (21 versus 11 percent). Salesworkers and operatives also were more heavily represented among single jobholders. In contrast, professional, technical, and service workers were more heavily represented among multiple than among single jobholders working 41 hours or more per week in May 1980. ☐

FOOTNOTES

[1] The Current Population Survey (CPS) is conducted for the Bureau of Labor Statistics by the Bureau of the Census. Information on the number of hours worked is collected monthly. A May supplement to the survey provided data on the receipt of premium pay for hours in excess of 40 per week and on multiple jobholding.

[2] Estimates of coverage under the Fair Labor Standards Act are from *Minimum Wages and Maximum Hours, Standards Under the Fair Labor Standards Act: An Economic Effects Study*, submitted to Congress in 1981 (U.S. Department of Labor, Employment Standards Administration, 1981), p. 42. For a history of the act, see Peyton K. Elder and Heidi D. Miller, "The Fair Labor Standards Act: changes of four decades," *Monthly Labor Review*, July 1979, pp. 10–16. The Federal Pay Act (U.S. Code, Title 5, ch. 61) covers Federal employees, while the Walsh-Healey Contracts Act (Public Law 74–846, June 30, 1936) and the Contract Work Hours and Safety Standards Act (Public Law 87–581, Aug. 13, 1961) apply to workers in firms holding Federal Government contracts.

Marital and family patterns of workers: an update

HOWARD HAYGHE

A record 18.4 million women with children under age 18 were in the labor force in March 1981, including nearly half of all mothers with preschool children. The high level indicates the continuing impact that women of the "baby boom" generation are having on the job market. Now in their 20's and early 30's, many of these women are returning to work while their children are still infants. This is also one reason why today every other married-couple family is in the dual-earner category.[1]

Over-the-year changes

Wives. Labor force changes during the 12 months ending with March 1981 were typical of those that have been observed in recent years in connection with the entry or re-entry into the job market of women born after World War II. About 25.5 million wives, or 51 percent, were working or looking for work in March, 560,000 above the previous year's level. More than 2 of 3 of these net additions were mothers, and most of them had children under 6 years old. (See table 1 and 2.)

The rise in the number and proportion of working mothers, especially those with preschool children, is partly related to a small rebound in births among women 20 to 34 years old.[2] During the 1970's, women in this age group tended to delay marriage and postpone childbearing, often acquiring lengthy job experience and strong ties to the labor force. Now most are married

and many are having children. But, unlike the preceding generation of mothers whose early marriage and childbearing was followed by prolonged withdrawal from the labor force,[3] women are now either remaining in the work force or returning to it shortly after childbirth.

Reflecting these events, the labor force participation rate of wives with preschool children increased from 45 percent in March 1980 to nearly 48 percent a year later. Even though there was no change in their participation rate, divorced mothers (regardless of their youngest child's age) remained considerably more likely than mothers in any other marital status category to be in the labor force. About 78 percent of all divorced mothers were working or looking for work in March 1981, compared with around 60 percent of widowed, separated, or never-married mothers and 56 percent of married mothers. Even when they were childless, divorced women were more apt to be in the labor force than other women with no children under age 18.

Single, divorced, and separated persons. Like wives, single persons also accounted for 25 percent of the labor force growth over the year ending with March 1981. The number of single men in the labor force reached 15.8 million while that of single women grew to 11.6 million. These increases were largely because of a rise in the number of persons in their early 20's and the continuing tendency among them to delay marriage. The labor force participation rates of single men (71 percent) and of women (62 percent) remained relatively stable.

As was the case for singles, the number of divorced and separated persons in the labor force rose, primarily because the divorce rate remained high. The labor force participation rates of separated and divorced men were about the same as for husbands (80 percent) while the rates for divorced (75 percent) and separated (61 percent) women continued to be higher than for wives.

In contrast to the other marital groups, the number of husbands who were working or looking for jobs remained steady over the year ending in March 1981. The participation rate of husbands continued its long-term downward drift.

Race and Hispanic origin. Although white wives are still less likely to be in the labor force than black ones, their participation rate has been rising faster in recent years, narrowing the difference between the two groups. By March 1981, more than 50 percent of white wives and nearly 60 percent of black wives were in the work force. Ten years earlier, the proportions were about 40 and 53 percent. In contrast, the participation rate, for white husbands and black husbands were nearly identical; both rates have declined by roughly 6 percentage points since March 1971.

Hispanic men were more apt than whites or blacks to be in the labor force regardless of their marital category. This is partly because Hispanic men are, on average, younger; in March 1981, their median age (for those 16 years and over) was 32.1 years, compared with 34 years for blacks and 38 years for whites. In contrast to the men, Hispanic women traditionally have had lower participation rates than whites or blacks.[4] (See table 3.)

Table 2. Labor force status of women 16 years and over, by marital status and presence and age of youngest child, March 1980 and March 1981

[Numbers in thousands]

Marital status and presence and age of children	Labor force			Labor force participation rate (in percent)

Earners, income, and poverty

During the past decade, the dramatic increase in the proportion of working wives has led to substantial gains in the number of married-couple families where both spouses were earners during the same year. In 1980, there were approximately 25.6 million such dual-earner families, 25 percent more than in 1970.[5] Over the same period, the traditional-earner family (married-couple families where the husband, but not the wife, was an earner) declined in importance—falling from 44 percent of all married couples in 1970 to less than 31 percent in 1980.[6]

However, despite the ongoing rise in the number of wives in the labor force, there was no change in either the number or proportion of dual-earner families from 1979 to 1980. Several factors interacted to produce this result. One was the sluggish economic climate that prevailed during 1980 which led to greater levels of unemployment than in 1979. Another was the continuing high level of divorces and the consequent breakup of many married-couple families. Also, the number of married couples without earners continued its long-term climb. From 1970 to 1980, the number of married persons 65 years and over rose by about a third, and the number of families with no earners reached 5.9 million. (See table 4.)

Income. Overall, median income in 1980 was $23,300 for married-couple families, compared with $10,230 for families maintained by women and $17,740 for those maintained by men (no spouse present). A major reason for the differences is that almost 60 percent of all married-couple families contained at least two earners, compared with 28 percent of the families maintained by women and 42 percent of those maintained by men. (This is not the entire explanation; even when there were two earners or more, families maintained by men or women had lower median annual incomes.)[7] Who the earners are—husband, wife, children, and so forth—is also an important determinant of family income. To illustrate, median income of married-couple families in 1980 was $20,500 where the husband was the only earner, but only $13,600 where the wife was the sole earner. For families with two earners or more, the median was more than $31,000 where the husband (but not the wife) was among the earners, but only $22,700 when the husband had no earned income.

Poverty. The presence of earners does not guarantee a family freedom from poverty. In 1980, about 6.4 million, or 10.5 percent, of the Nation's families had incomes below the poverty level.[8] These families were approximately equally divided between married couples (47 percent) and those maintained by women (49 percent), with relatively few maintained by men. (See table 5.)

The majority of married-couple families in poverty had income from the earnings of one member or more during 1980. In most of these families, the husband was an earner, but for an unusually large proportion—21 percent compared with 6 percent for families not in poverty—the earner was the wife or some other member, such as a son or daughter, whose wages were typi-

Table 4. Number of earners in families, relationship, and median family income in 1979 and 1980, by type of family, March 1980 and March 1981

One earner	115	51.3	12.9
Two earners or more	32	14.3	3.8

[1] Includes only divorced, separated, widowed, or never-married persons.

NOTE: Because of rounding, sums of individual items may not equal totals.

cally lower than those of the husband.

A third of all families maintained by women had incomes below the poverty level in 1980, with children in more than four-fifths of them. Less than half of these families had earnings and only 8 percent contained more than one earner.

As expected, large families face a greater likelihood of poverty than small ones with the same number of earners. For instance, among one-earner families in 1980, about 10 percent with only two members were in poverty, compared with 20 percent of five-member families. The proportions in poverty were less for families with more than one earner.

THIS REPORT HAS PRESENTED some recent data on the marital-family characteristics of workers. However, the situation may change under the pressure of demographic and other trends that are already underway. For example, recent increases in the birth rate indicate that the number of dual-earner families with young children will continue to increase. Thus, the need for adequate child care in the working parents' absence will probably expand rather than diminish. In addition, if marital breakups—currently at record levels—rise, the demand for child care will grow even further as the number of one-parent families increases. ☐

FOOTNOTES

[1] Unless otherwise indicated, data are based on tabulations from the March 1981 Current Population Survey (CPS), conducted for the Bureau of Labor Statistics by the Bureau of the Census. The data have been inflated using population weights based on results from the 1980 Census of the Population. The March 1980 data discussed in this report also have been revised to bring them in line with the new population weights and to make them comparable with the March 1981 data. Previously published 1980 data (as they appear in Beverly L. Johnson and Elizabeth Waldman, "Marital and family patterns," *Monthly Labor Review*, October 1981, pp. 36–38) reflected population weights projected forward from the 1970 Census of the Population.

As shown in table 1, the number of married women in the labor force in March 1980 was revised upward by 434,000. Despite this, and similarly significant changes in other data for 1980, the various relationships and percentages based on new estimates are nearly the same as those based on previously published estimates.

For a more complete description of changes in labor force data stemming from the use of 1980 census population weights in the CPS, see Kenneth D. Buckley, Jennifer Marks, and Ronald J. Statt, "Revisions in the Current Population Survey Beginning in January 1982," *Employment and Earnings*, February 1982, pp. 7–15.

Estimates based on a sample, such as those shown in the tables, may vary considerably from results obtained by a complete count in those cases where the numbers are small. Therefore, differences based on them may not be significant. For more detail on the interpretation of such differences, see *Marital and Family Characteristics of Workers, March 1979*, Special Labor Force Report 237 (Bureau of Labor Statistics, 1981).

[2] Final Natality Statistics, National Center for Health Statistics, Division of Vital Statistics, Natality Statistics. Also see Allyson Sherman Grossman, "More than half of all children have working mothers," *Monthly Labor Review*, February 1982, pp. 41–43, for information on trends in numbers of children whose mothers work.

Norwood and Elizabeth Waldman, *Women in the Labor Force: Some New Data Series*, U.S. Department of Labor, Report 575; and George Masnich and Mary Jo Bane, *The Nation's Families, 1960–1990* (Cambridge, Mass., Joint Center for Urban Studies of the Massachusetts Institute of Technology and Harvard University, 1980), pp. 52–85.

[4] For a discussion of some of the factors underlying the labor force patterns of Hispanic women, see Morris J. Newman, "A profile of Hispanics in the U.S. work force," *Monthly Labor Review*, December 1978, pp. 3–14.

[5] Only about two-fifths of the gain in the number of dual-earner families was because of the increase in the number of married-couple families.

[6] See Howard Hayghe, "Husbands and wives as earners: an analysis of family data," *Monthly Labor Review*, February 1981, pp. 46–53.

[7] A forthcoming *Monthly Labor Review* article will focus on women who maintain families.

[8] The average poverty threshold for a nonfarm family of four was $8,414 in 1980. The level varied depending on family size, sex and age of householders, family composition, and farm-nonfarm residence. For further details, see *Current Population Reports*, Series P–60, No. 124.

Major Agreements Expiring Next Month

This list of collective bargaining agreements expiring in June is based on contracts on file in the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more.

Employer and location	Industry	Union[1]	Number of workers
AGRIPAC, Inc. (Oregon)	Food products	Teamsters (Ind.)	3,000
Air Conditioning Contractors of Arizona	Construction	Sheet Metal Workers	1,200
Allied Chemical Corp., Industrial Chemical Division (New York)	Chemicals	Steelworkers	1,200
Almacs, Inc. (Rhode Island, Massachusetts, and Connecticut)	Retail trade	Food and Commercial Workers	2,300
American Motors Corp., AM General Corp. (Indiana)	Transportation equipment	Auto Workers (Ind.)	1,500
Associated Building Contractors of Northwestern Ohio, Inc., 2 agreements	Construction	Laborers; Carpenters	3,000

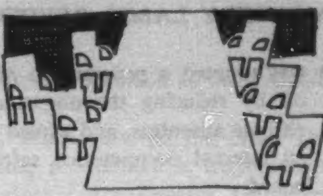
Developments in Industrial Relations



GM-UAW agreement

General Motors Corp. and the Auto Workers agreed to a 30-month accord that paralleled the terms of the union's February agreement with Ford Motor Co. (See *Monthly Labor Review*, April 1982, p. 62.) GM and UAW officials said they were optimistic that the new contract will help alleviate the severe sales and employment downturn that has afflicted the domestic automobile industry for several years. The day after the settlement, domestic car makers reported that they built 325,000 units in February, a decline of more than 32 percent from February of 1981, and the lowest total for that month since 1948.

UAW President Douglas A. Fraser emphasized that the job security aspects of the agreement would "stop the hemorraging of GM workers' jobs." Currently, 320,000 UAW members are on the job at GM and 140,000 are on layoff. Alfred S. Warren Jr., the company's vice president for industrial relations, called the accord "historic" because it recognizes the unexpected changes taking place in world competition.

The GM contract was effective immediately, superseding the current contract which would have expired in September. The new contract did not provide for any specified wage increases. The cost-of-living pay adjustment provision differed slightly at the two companies, but the goal was the same—to equalize labor cost increases. At GM, the June and September 1982 cost-of-living adjustments will each be deferred 18 months, as will 10 cents of any adjustment that occurs in December 1982. The 10-cent December deferral was intended to offset the 10-cent cost-of-living adjustment effective in March 1982 under provisions of the 1979 contract. The Ford settlement provided for 18 month deferrals of the 10 cents adjustment normally effective in March 1982, as well as the June and September 1982 quarterly adjustments.

There also were other differences between the GM and Ford contracts:

- The GM contract called for the company to reopen four of the six plants it had closed after the parties had temporarily broken off negotiations in January. The four plants employed about 5,000 UAW members. In addition, GM agreed to aid some of the 5,000 workers affected by the closing of the other two plants, located in California, by permitting laid-off employees with 10 years of service to participate in the Guaranteed Income Stream program. GM also agreed to reopen one other plant and to transfer 1,500 employees affected by the closing of a stamping plant in Cleveland. At Ford, eligibility for the Guaranteed Income Stream was limited to laid off employees with 15 years of service. The Ford accord did not provide for the reopening of any plants. However, Ford announced the reopening of a valve plant, a result of the contract provision limiting the purchase of parts from other companies.
- At GM, a legal services plan was established, financed by company funding of 3 cents an hour per worker. Legal representation will be provided by the plan's staff attorneys. Ford workers did not win a legal services plan (but the parties will study such plans), opting instead for an increase in the company's financing of Supplemental Unemployment Benefits.
- The new profit-sharing plan at GM calls for employees to receive 10 percent of that portion of the company's U.S. pretax profit in excess of the sum of 10 percent of net worth and 5 percent of other assets. Any resulting distribution to GM workers will be reduced by 0.1 percent of the value of the "other asset" to help defray the cost of extending the Guaranteed Income Stream to cover laid-off workers with 10 years of service. The union admitted that this formula was not as liberal as the Ford formula, but asserted that GM workers still would fare better because of GM's better operating results. According to union officials, over the preceding 6 years, GM workers would each have received $2,231 under their new formula, and Ford workers would have received $826 under their formula.
- At GM, the pilot "lifetime job guarantee" program will be tested at four plants, compared with two plants at Ford. Percentagewise, these numbers are equivalent because GM hase more plants than Ford.

"Developments in Industrial Relations" is prepared by George Ruben and other members of the staff of the Division of Developments in Labor-Management Relations, Bureau of Labor Statistics, and is largely based on information from secondary sources.

- GM adopted a program to reduce unwarranted time off by reducing the nonwage benefits available for chronic absentees, and agreed to establish and finance an internal occupational safety and health advisory board.

The ratification vote tally, announced by the UAW in mid-April was 114,510 to 105,297 in favor of the agreement.

The International Union of Electrical Workers also negotiated similar terms for the 22,000 workers it represents at GM plants.

Elsewhere, at General Motors, the company confirmed that it was laying off some salaried employees with low performance ratings and reducing the severance pay and other monetary benefits of the others. A GM official said that the actions will involve "a very limited number" of the company's 137,000 salaried employees in the United States and Canada.

Wage-and-benefit concessions

Workers at Gulf and Western automobile parts plants in Mancelona and East Jordan, Mich., voted to accept a $1.54-an-hour pay cut to avert closing of some plants. The company said it needed the pay cut and a 2-year freeze on future wage-and-benefit improvements to compete effectively for production contracts. At the time of the settlement, layoffs had reduced the combined work force in these plants to 200, from 600.

Members of Allied Industrial Workers Local 78 in Kent, Ohio, agreed to labor concessions to avert the closing of a Russell Burdsall and Ward Corp. plant. The 260 workers at the auto parts plant accepted a $2.40-an-hour reduction in their cost-of-living allowance, reductions in paid holidays and vacations, and establishment of an incentive pay plan. Union officials said the concessions resulted from pressure by the major automobile manufacturers for lower prices from their suppliers.

In Louisville, Ky., members of four unions at Standard Gravure Co. agreed to a 5-year moratorium on wage increases and suspension of certain restrictive work practices. In exchange, the company agreed to invest $13.5 million in new printing equipment to improve its competitive ability, and to institute a profit-sharing plan.

Plans to return the bankrupt Milwaukee Railroad to profitability by 1985 moved forward, as a Federal district court approved a 7-percent wage reduction that will apply to 7,000 persons, including management and members of about 13 unions. In addition to negotiating a paycut for their members, the unions also agreed to reductions in train crew sizes which may result in the layoff of more than 500 workers within 6 months. The paycut, scheduled to extend to the end of 1984, was expected to save the railroad $44 million and the reduction in crew size was expected to save $56 million over a 5-year period. In his recovery plan, bankruptcy trustee Richard Oglvie projected that in 1985, the railroad would be a 2,900 mile system with about 6,000 employees. In 1977, when the bankruptcy proceedings began, the railroad had 10,000 miles of track and 11,000 employees.

Volkswagen of America moved to reduce labor costs by limiting payment of its cost-of-living allowance for salaried employees to straight time hours worked. Previously, the 4,000 workers had also received the allowance for overtime hours and for vacations, holidays, and sick days. Earlier, the company had postponed plans to build a second plant in the United States. The 4,600 UAW-represented production workers at the Volkswagen plant in Westmoreland County, Pa., negotiated a 16-month agreement in late 1981 that provided for an immediate 50-cent-an-hour wage increase, for a 10-cent-an-hour increase in June 1982, and for a 1982 specified wage increase that matched the specified increase resulting from the GM-UAW negotiations. There were no indications whether Volkswagen was planning to ask for revisions in its agreement because of the labor cost concessions included in the 1982 GM settlement.

The 550 employees of the McCreary Tire & Rubber Co. of Indiana, Pa., were expected to attain 70 percent ownership of the plant within 7 years under an Employee Stock Ownership Plan announced in late 1981. The purchase will be financed by withholding scheduled pay increases. The 400 production employees, who are represented by the United Rubber Workers, will forgo 50 cent increases in both 1982 and 1983. Similarly, the 175 salaried employees, who are not represented by a union, will forgo 5 percent pay increases in both years. McCreary specializes in truck tires, but also makes tires for farm and construction equipment and racing cars.

In the Detroit area, members of Teamsters' Local 337 and the Kroger Co. and A&P supermarket chains agreed on a wage freeze that will extend 18 months beyond the scheduled March 31, 1984, expiration date of current agreements. Bargaining on wage-and-benefit concessions was continuing between various unions and Kroger and other chains in the area. The stores contended that labor cost relief was needed to enable them to compete effectively with nonunion chains, which they claimed had a $5-an-hour edge in labor costs.

At Acme-Cleveland Corp.'s plant in Cleveland, Ohio, workers agreed to eliminate ceilings on the output of pieceworkers. In return for the change—which a union official said would result in higher earnings for some of the employees—the maker of machine tools guaranteed the 647 remaining jobs until the September 1982 expiration of its contract with the Mechanics Educational Society. Company officials indicated that the termination of the piecework ceiling and the elimination of 500 jobs in the past 2 years had been necessitated by a "noncompetitive" labor cost structure.

In Jefferson, Wisc., employees of Borg Textiles Corp. agreed to a number of contract changes in an effort to keep the plant in operation. The changes include a 1-year extension of their contract (to May 1984); a $1.38-an-hour pay cut, (pay had ranged from $7.93 to $9.74 an hour); a 40-percent reduction in paid vacation days (the workers will receive the lost money after January 1, 1983); postponement of payments to workers for gains in productivity; and postponement of a 6-percent wage increase and a cost-of-living adjustment of up to 26 cents an hour that had been scheduled for May 1982. The company and the Ladies Garment Workers will meet in January 1983 to discuss possible restoration of the wage-and-benefit cuts. Union official Donald Kret attributed the plants' problems to a decline in demand for artificial fur and paint brush roller fabric. He said that other apparel manufacturers in the region were pressing for labor cost cuts. At the time of settlement, two-thirds of the firm's 140 employees were on layoff.

The round of bargaining at major meat processing companies closed when employees at several Oscar Mayer & Co. plants accepted a wage freeze extending to August 31, 1985. Actually, the employees accepted a pay cut because they gave up the 30-cent-an-hour cost-of-living adjustment they received in January under the superseded contract, which had been scheduled to expire in August. Workers at the other meat processing companies (Armour, Wilson, Swift, and Hormel) did not get a pay cut because their wage freezes were negotiated in December 1981. (See *Monthly Labor Review*, February 1982, p. 48.) Other contract terms at Oscar Mayer were similar to those at the other companies.

Plant closings

The Potter and Brunfield Division of AMF Inc. closed its electromagnetic relay switch plant in San Juan Capistrano, Calif., to "consolidate excess capacity" in six other AMF plants. About 300 workers were involved. Some of the employees charged that the closing resulted from a company decision to shift some production to its plant in Mexico, which has lower labor costs. The plant manager acknowledged that this may have been a factor in the decision, but pointed out that the California plant was the smallest in the chain and the most distant from corporate headquarters in Princeton, Ind. According to the Bank of Mexico, U.S. companies now operate 225 plants across the border, employing 133,000 workers who earn about one-fourth as much as their American counterparts.

Scottdale Mills Ltd., which survived the Great Depression without reducing production or employment, announced that it was closing. The Decatur, Ga., company attributed its demise to foreign competition. About 500 employees were affected. Elsewhere in the textile industry, J. P. Stevens & Co. began phasing out its denim plant in Rock Hill, S.C. About 540 employees were affected.

The Singer Co. announced that it was closing its industrial sewing machine plant in Elizabeth, N.J., because worldwide recessions and high interest rates had accelerated a slump in demand for its machines. The decision affected 560 employees. Most of Singer's machines are produced in Brazil and Japan.

The Allis-Chalmers Corp. announced plans to close its foundry in West Allis, Wisc., after members of Auto Workers Local 248 rejected a request for an $8-an-hour cut in wages and benefits. Officials of the foundry, which produces castings for farm machinery, said the cut was necessary because its workers averaged $23 an hour in wages and benefits, nearly twice as much as some competitors. However, union officials attributed the foundry's problems to the company's failure to modernize the facility.

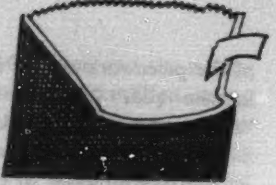
Hospital workers get new contracts

In Northern California, Service Employees Local 250 negotiated a 2-year contract for employees of 18 hospitals and medical centers of the Kaiser Permanente Medical Care Program. According to the union, the accord makes the 7,500 workers the Nation's highest paid service employees in hospitals and clinics.

Provisions included an 11-percent pay raise on November 1, 1981, a 9-percent raise on October 31, 1983, and upgrading of several job classifications. The highest paid employees in the bargaining unit are pharmacists, who will receive $17.30 an hour after the 1983 pay increase.

What may have been the longest nurses strike in American history ended when registered nurses employed by Ashtabula (Ohio) General Hospital ratified a contract calling for a 9-percent salary increase. They also received an 11.9-percent increase that the hospital put into effect in May 1981. The strike lasted for more than 18 months and involved 170 nurses when it began in July 1980. In subsequent months, 50 nurses returned to work and 20 quit their jobs. The nurses are represented by the American Nurses Association. □

Book Reviews



The unspeakable

Fellow Workers and Friends: IWW Free-Speech Fights as Told by Participants. Edited by Philip Foner. Westport, Conn., Greenwood Press, 1981. 242 pp. $29.95.

There is a plethora of current interest in the much celebrated labor union of the early 20th century, the Industrial Workers of the World (IWW). Popularly called the "Wobblies," they have an unparalleled place in labor history and are a fascinating subject for motion pictures, books, and museum exhibits. One example is the movie, "Reds," a chronicle of the life of IWW member John Reed. The Botto House, headquarters for the Wobblies during the famous Paterson (N.J.) Silk Workers Strike of 1913, has been designated a historic landmark. Even the Smithsonian Institution, in a recent labor history exhibit, displayed some Wobbly memorabilia. *Fellow Workers and Friends* keeps faith with such current interest.

This book is an anthology of the so-called "Free-Speech Fights," occurring between 1909 and 1916, and pitting IWW organizers against local municipal authorities. Ten such "fights" ensued, most of them in the western half of the United States: Missoula, Mont.; Spokane and Everett, Wash.; Fresno and San Diego, Calif.; Aberdeen, S. Dak.; Minot, N. Dak.; Denver, Colo.; and Kansas City, Mo. The Wobblies attempted to organize the mass of itinerant, and often illiterate, migratory workers who labored in the mining camps, timberlands, and agricultural valleys of the West. Fearful of the radical labor union, established interests, especially Chambers of Commerce, tried to restrict IWW activities by prohibiting open-air speeches in public areas.

The "gag rules" against public speaking hit the Wobblies in the jugular. If prevented from spreading their creed, the union would have little chance of recruiting members. To retaliate, they called transient Wobblies from the four corners of the Nation to descend on the site of an impending free-speech battle. A telegram sent to all IWW offices from national Secretary-Treasurer Vincent St. John vividly illustrated their sincerity: "If you are footloose, make for Kansas City at once, . . . wire the local you are coming."

With a high concentration of sympathetic Wobblies in one area, the local union leadership implemented battle plans. They paraded, en masse, to a public area where a man or woman stood on a "soap box" and cried out, "Fellow Workers and Friends," to the gathering crowds. That brief oration usually resulted in the speaker's arrest. But another IWW member immediately ascended the podium and repeated the same four words. Soon, the jails were overflowing with the speakers, taxing the municipal resources of the locality to the breaking point, and forcing, in most cases, the rescission of anti-free speech laws.

The personal stories of the free-speech participants are a fine mixture of pathos and humor. For example, one IWW member recalled the woeful tale of Michael Hoey, a 65-year-old member of the union, who was arrested and jailed by San Diego police for speaking in public. The jailers beat him mercilessly, kicked him repeatedly in the groin, and left him in a semiconscious state. He died 40 days later, allegedly from the injuries received in jail.

Even more heinous violations of civil liberties were recorded and experienced by union member Agnes Thecla Fair. After her arrest in Spokane, Wash., the civil authorities attempted to remove her clothing while she was in custody, threatening her with rape. The young Wobbly described her plight further, stating:

> I was hardly over the first (episode) when they brought in a man disguised as a woman and put him in a cot next to me. I thought it was a drunken woman until the officers went out. Then I felt a large hand creeping over me. It's too horrible (to continue) . . . !

Yet, the free-speech fights had lighter moments. Elizabeth Gurley Flynn, the notorious "Rebel Girl," told of one comrade who found himself released from custody when the police officer escorting him to jail stumbled across two brawling drunkards and arrested them. The constable noticed the big, strapping Wobbly tagging along behind them and asked, "What are you doing here?" The free-speech fighter retorted, "What do you want me to do, go back there and make another speech?"

In addition to the personal vignettes, the book also contains entertaining chapter introductions, including a broad overview on the origins and development of the IWW. Few labor historians are better qualified to evaluate this aspect of the labor movement than Philip Foner. His expertise is widely recognized and his anecdotal style adds spice to an already lively topic. For example, he briefly explains that Elizabeth Gurley Flynn, one of the earliest feminists, had her family's support, and, in fact, was delivered by a woman doctor at birth. Foner also explains that the derivation of the term "Wobbly" originated from the inability of a Chinese waiter in California to say IWW. It is quite obvious that, for Foner, this book was a labor of love.

Foner is one of our most brilliant, yet controversial historians. Often criticized for letting his Marxist ideology distort the historical picture he paints, in this book, he apparently tempers his political inclinations. However, there is an overglorification of the radical Wobblies, and this is the one flaw in the monograph. Foner fails to show, as does Paul Bressenden—the dean of IWW scholars—in his monograph on the subject, that the seditious and unpatriotic language utilized by the Wobblies very often sent ripples of fear through even moderate members of local communities, let alone the labor baiters. But this book is for the students of the labor movement and they should, by now, be aware of Foner's proclivities.

On a positive reflection, Foner has once again championed the participation of blacks, women, immigrants, and other minorities in the labor movement. He vividly illustrates that the IWW targeted their energies toward organizing the largely unskilled work force of the Nation, the "Dagoes, Hunks, and Bohunks," often shunned by the rival American Federation of Labor. As Foner states in one chapter introduction, the Wobblies elevated the transient unskilled working class, giving them their own anthem in the song "Hallelujah, I'm a Bum."

Fellow Workers and Friends is an outstanding companion to similar anthologies such as Joyce Kornbluh's *Rebel Voices,* and Foner's *The Letters of Joe Hill.* It complements several narratives on the IWW including Patrick Renshaw's *The Wobblies* and, again, Foner's *The Industrial Workers of the World, 1905–1917.*

In light of recent political and social trends, this study is timely and important. The constitutional questions on what constitutes "free speech" and the first amendment are, even now, causing debate in Congress. *Fellow Workers and Friends* should interest both rightist and leftist sides of the U.S. political spectrum and should cause neither to see red.

More recent arrivals

Immigration: New Americans, Old Questions. Edited by Melinda Maidens. New York, Facts on File, 1981. 190 pp. $17.50.

Instead of the 450,000 legal immigrants and refugees anticipated by U.S. law, over 1 million legal immigrants, refugees, and illegal aliens entered the United States in 1981. Like his predecessors, President Reagan appointed a study group to examine immigration and refugee problems and suggest reforms that will enable America to reassert control over its borders.

The Select Commission on Immigration and Refugee Policy issued its final report in March 1981. A series of congressional hearings was held on immigration problems and reform proposals in 1981 and 1982. Three comprehensive reform packages are now awaiting congressional action. President Reagan has proposed a limited amnesty for aliens now in the United States illegally, Federal sanctions on employers who knowingly hire illegal aliens, and a streamlining of Immigration and Naturalization Service procedures. Senator Walter D. Huddleston (D-Ky.) has proposed more sweeping enforcement measures designed to reduce the influx of aliens and a fixed cap on total legal immigration to the United States. Senator Alan K. Simpson (R-Wyo.) modified the Reagan administration proposals by deleting the temporary guestworker idea and its strengthening enforcement provisions. Public opinion and this spectrum of reform options promise to make 1982 a year of further debate and possible action on immigration reform.

This book is a collection of newspaper articles and editorials that helps explain why the immigration issue arouses so much debate and so little action. The articles, published between 1978 and 1981, discuss immigration, refugees, and policy. Many of the editorials are from lesser known newspapers, for example, *The Tulsa World, The Arkansas Democrat,* and *The Sacramento Bee.*

The theme running through most of the articles and editorials is the need to continue American compassion for the world's "huddled masses," but to temper our compassion in this age of limits. For example, most newspapers endorsed the initial Cuban offer of 1,000 political prisoners in the fall of 1978, arguing that American acceptance of these Cubans would demonstrate to the world the economic and moral failures of Cuban socialism. However, when Cubans began streaming across the Florida straits in small boats one and one-half years later, these same newspapers demanded that the government reassert control over who enters America. Most newspapers demanded a similar tough line when Cubans, impatient to be resettled, rioted at Fort Chaffee, Ark.

This book does not contain interpretive articles that help explain the evolution or future direction of U.S. immigration policies. It is rather a chronicle of America's response to immigration issues that were salient between 1978 and 1980. It is a valuable mirror of our diversity in a time when we seek consensus.

Current Labor Statistics

Notes on Current Labor Statistics 68

Schedule of release dates for major BLS statistical series 68

Employment data from household survey. Definitions and notes 69
1. Employment status of noninstitutional population, selected years, 1950–81 69
2. Employment status by sex, age, and race, seasonally adjusted 70
3. Selected employment indicators, seasonally adjusted 71
4. Selected unemployment indicators, seasonally adjusted 72
5. Unemployment rates, by sex and age, seasonally adjusted 73
6. Unemployed persons, by reason for unemployment, seasonally adjusted 73
7. Duration of unemployment, seasonally adjusted 73

Employment, hours, and earnings data from establishment surveys. Definitions and notes 74
8. Employment by industry, selected years, 1950–81 75
9. Employment by State 76
10. Employment by industry division and major manufacturing group 76
11. Employment by industry division and major manufacturing group, seasonally adjusted 77
12. Hours and earnings, by industry division, selected years, 1950–81 78
13. Weekly hours, by industry division and major manufacturing group 79
14. Weekly hours, by industry division and major manufacturing group, seasonally adjusted 80
15. Hourly earnings, by industry division and major manufacturing group 81
16. Hourly Earnings Index, by industry division, seasonally adjusted 81
17. Weekly earnings, by industry division and major manufacturing group 82

Unemployment insurance data. Definitions 83
18. Unemployment insurance and employment service operations 83

Price data. Definitions and notes 84
19. Consumer Price Index, 1967–81 85
20. Consumer Price Index, U.S. city average, general summary and selected items 86
21. Consumer Price Index, cross classification of region and population size class 91
22. Consumer Price Index, selected areas 92
23. Producer Price Indexes, by stage of processing 93
24. Producer Price Indexes, by commodity groupings 94
25. Producer Price Indexes, for special commodity groupings 96
26. Producer Price Indexes, by durability of product 96
27. Producer Price Indexes for the output of selected SIC industries 96

Productivity data. Definitions and notes 99
28. Annual indexes of productivity, hourly compensation, unit costs, and prices, selected years, 1950–81 99
29. Annual changes in productivity, hourly compensation, unit costs, and prices, 1971–81 100
30. Quarterly indexes of productivity, hourly compensation, unit costs, and prices, seasonally adjusted 100
31. Percent change from preceding quarter and year in productivity, hourly compensation, unit costs, and prices .. 101

Labor-management data. Definitions 102
32. Wage and benefit settlements in major collective bargaining units, 1977 to date 102
33. Effective wage rate adjustments in major collective bargaining units, 1977 to date 102
34. Work stoppages involving 1,000 workers or more, 1947 to date 103

NOTE

Because of the deletion of former tables 12, 13, and 20, the succeeding tables have been renumbered.

NOTES ON CURRENT LABOR STATISTICS

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics. A brief introduction to each group of tables provides definitions, notes on the data, sources, and other material usually found in footnotes.

Readers who need additional information are invited to consult the BLS regional offices listed on the inside front cover of this issue of the *Review*. Some general notes applicable to several series are given below.

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might otherwise mask short-term movements of the statistical series. Tables containing these data are identified as "seasonally adjusted." Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years.

Seasonally adjusted labor force data in tables 2-7 were revised in the March 1982 issue of the *Review* to reflect experience through 1981. The original estimates also were revised to 1970 to reflect 1980 census population controls.

Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X-11/ARIMA, which was developed at Statistics Canada as an extension of the standard X-11 method. A detailed description of the procedure appears in *The X-11 ARIMA Seasonal Adjustment Method* by Estela Bee Dagum (Statistics Canada Catalogue No. 12-564E, February 1980). The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. Revisions of historical data continue to be made only at the end of each calendar year.

Annual revision of the seasonally adjusted payroll data in tables 11, 14, and 16 begins with the August 1980 issue using the X-11 ARIMA seasonal adjustment methodology. New seasonal factors for productivity data in tables 30 and 31 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The resulting values are described as "real," "constant," or "1967" dollars.

Availability of information. Data that supplement the tables in this section are published by the Bureau of Labor Statistics in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule given below. The *BLS Handbook of Labor Statistics*, Bulletin 2070, provides more detailed data and greater historical coverage for most of the statistical series presented in the *Monthly Labor Review*. More information from the household and establishment surveys is provided in *Employment and Earnings*, a monthly publication of the Bureau. Historically, comparable information from the establishment survey is published in two comprehensive data books—*Employment and Earnings, United States* and *Employment and Earnings, States and Areas, and their annual supplements*. More detailed information on wages and other aspects of collective bargaining appears in the monthly periodical, *Current Wage Developments*. More detailed price information is published each month in the periodicals, the *CPI Detailed Report* and *Producer Prices and Price Indexes*.

Symbols

p = preliminary. To improve the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
r = revised. Generally, this revision reflects the availability of later data but may also reflect other adjustments.
n.e.c. = not elsewhere classified.

Schedule of release dates for major BLS statistical series

Series	Release date	Period covered	Release date	Period covered	MLR table number
Employment situation	May 7	April	June 4	May	1-11
Producer Price Index	May 14	April	June 11	May	23-27
Consumer Price Index	May 21	April	June 22	May	19-22
Real earnings	May 21	April	June 22	May	12-17
Productivity and costs:					
Nonfinancial corporations	May 26	1st quarter	....	....	28-31

EMPLOYMENT DATA FROM THE HOUSEHOLD SURVEY

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 60,000 households beginning in May 1981, selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons are (1) those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population; the **total labor force** includes military personnel. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons retired, those engaged in their own housework, those not working while attending school, those unable to work because of long-term illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy.

Full-time workers are those employed at least 35 hours a week; **part-time workers** are those who work fewer hours. Workers on part-time schedules for economic reasons (such as slack work, terminating or starting a job during the week, material shortages, or inability to find full-time work) are among those counted as being on full-time status, under the assumption that they would be working full time if conditions permitted. The survey classifies unemployed persons in full-time or part-time status by their reported preferences for full-time or part-time work.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data presented in table 1. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings.*

Data in tables 2–7 are seasonally adjusted, based on the seasonal experience through December 1981.

1. Employment status of the noninstitutional population, 16 years and over, selected years, 1950–81

[Numbers in thousands]

Year	Total noninstitutional population	Total labor force		Civilian labor force						Not in labor force

NOTE: Effective with January 1982 data, population counts derived from the 1980 census are incorporated into the estimation procedures used in the Current Population Survey. Data for 1970-81 have been revised. Also, seasonally adjusted data have been revised based on the seasonal experience through December 1981.

EMPLOYMENT, HOURS, AND EARNINGS DATA FROM ESTABLISHMENT SURVEYS

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by 166,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

Definitions

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 12–17 include production workers in manufacturing and mining; construction workers in construction; and nonsupervisory workers in transportation and public utilities; in wholesale and retail trade; in finance, insurance, and real estate; and in services industries. These groups account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to eliminate the effects of price change, using the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W). The **Hourly Earnings Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of June 1981 data, published in the August 1981 issue of the *Review*. Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Complete comparable historical unadjusted and seasonally adjusted data are published in a Supplement to Employment and Earnings (unadjusted data from April 1977 through March 1981 and seasonally adjusted data from January 1974 through March 1981) and in *Employment and Earnings, United States, 1909–78*, BLS Bulletin 1312–11 (for prior periods).

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20. See also *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976).

NOTE: The industry divisions of mining; construction; tobacco manufactures (a major manufacturing group, nondurable goods); transportation and public utilities; and finance, insurance, and real estate are no longer shown. This is because the seasonal component in these is small relative to the trend-cycle, or irregular components, or both, and consequently cannot be precisely separated.

UNEMPLOYMENT INSURANCE DATA

NATIONAL UNEMPLOYMENT INSURANCE DATA are compiled monthly by the Employment and Training Administration of the U.S. Department of Labor from monthly reports of unemployment insurance activity prepared by State agencies. Railroad unemployment insurance data are prepared by the U.S. Railroad Retirement Board.

Definitions

Data for **all programs** represent an unduplicated count of insured unemployment under State programs, Unemployment Compensation for Ex-Servicemen, and Unemployment Compensation for Federal Employees, and the Railroad Insurance Act.

Under both State and Federal unemployment insurance programs for civilian employees, insured workers must report the completion of at least 1 week of unemployment before they are defined as unemployed. Persons not covered by unemployment insurance (about 10 percent of the labor force) and those who have exhausted or not yet earned benefit rights are excluded from the scope of the survey. **Initial claims** are notices filed by persons in unemployment insurance programs to indicate they are out of work and wish to begin receiving compensation. A claimant who continued to be unemployed a full week is then counted in the insured unemployment figure. The **rate of insured unemployment** expresses the number of insured unemployed as a percent of the average insured employment in a 12-month period.

An **application** for benefits is filed by a railroad worker at the beginning of his first period of unemployment in a benefit year; no application is required for subsequent periods in the same year. **Number of payments** are payments made in 14-day registration periods. The **average amount of benefit payment** is an average for all compensable periods, not adjusted for recovery of overpayments or settlement of underpayments. However, **total benefits paid** have been adjusted.

18. Unemployment insurance and employment service operations

[All items except average benefits amounts are in thousands]

Item	1981											1982

[1] Initial claims and State insured unemployment include data under the program for Puerto Rican sugarcane workers.

[2] Includes interstate claims for the Virgin Islands. Excludes transition claims under State programs.

[3] Excludes data on claims and payments made jointly with other programs.

[4] Excludes data on claims and payments made jointly with State programs.

[5] Cumulative total for fiscal year (October 1-September 30). Data computed quarterly.

NOTE: Data for Puerto Rico and the Virgin Islands included. Dashes indicate data not available.
c=corrected.

PRICE DATA

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Definitions

The Consumer Price Index is a monthly statistical measure of the average change in prices in a fixed market basket of goods and services. Effective with the January 1978 index, the Bureau of Labor Statistics began publishing CPI's for two groups of the population. One index, a new CPI for All Urban Consumers, covers 80 percent of the total noninstitutional population; and the other index, a revised CPI for Urban Wage Earners and Clerical Workers, covers about half the new index population. The All Urban Consumers index includes, in addition to wage earners and clerical workers, professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctor's and dentist's fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. Prices are collected from over 18,000 tenants, 24,000 retail establishments, and 18,000 housing units for property taxes in 85 urban areas across the country. All taxes directly associated with the purchase and use of items are included in the index. Because the CPI's are based on the expenditures of two population groups in 1972–73, they may not accurately reflect the experience of individual families and single persons with different buying habits.

Though the CPI is often called the "Cost-of-Living Index," it measures only price change, which is just one of several important factors affecting living costs. Area indexes do not measure differences in the level of prices among cities. They only measure the average change in prices for each area since the base period.

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes contains about 2,800 commodities and about 10,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (that is, finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings.

Price indexes for the output of selected SIC industries measure average price changes in commodities produced by particular industries, as defined in the *Standard Industrial Classification Manual 1972* (Washington, U.S. Office of Management and Budget, 1972). These indexes are derived from several price series, combined to match the economic activity of the specified industry and weighted by the value of shipments in the industry. They use data from comprehensive industrial censuses conducted by the U.S. Bureau of the Census and the U.S. Department of Agriculture.

Notes on the data

Beginning with the May 1978 issue of the *Review*, regional CPI's cross classified by population size, were introduced. These indexes will enable users in local areas for which an index is not published to get a better approximation of the CPI for their area by using the appropriate population size class measure for their region. The cross-classified indexes will be published bimonthly. (See table 21.)

For further details about the new and the revised indexes and a comparison of various aspects of these indexes with the old unrevised CPI, see *Facts About the Revised Consumer Price Index*, a pamphlet in the Consumer Price Index Revision 1978 series. See also *The Consumer Price Index: Concepts and Content Over the Years*, Report 517, revised edition (Bureau of Labor Statistics, May 1978).

For interarea comparisons of living costs at three hypothetical standards of living, see the family budget data published in the *Handbook of Labor Statistics, 1977*, Bulletin 1966 (Bureau of Labor Statistics, 1977), tables 122–133. Additional data and analysis on price changes are provided in the *CPI Detailed Report* and *Producer Prices and Price Indexes*, both monthly publications of the Bureau.

As of January 1976, the Wholesale Price Index (as it was then called) incorporated a revised weighting structure reflecting 1972 values of shipments. From January 1967 through December 1975, 1963 values of shipments were used as weights.

For a discussion of the general method of computing consumer, producer, and industry price indexes, see *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), chapters 13–15. See also John F. Early, "Improving the measurement of producer price change," *Monthly Labor Review*, April 1978, pp. 7–15. For industry prices, see also Bennett R. Moss, "Industry and Sector Price Indexes," *Monthly Labor Review*, August 1965, pp. 974–82.

[1] Data for November 1981 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[2] Prices for natural gas are lagged 1 month.

[3] Includes only domestic production.

[4] Most prices for refined petroleum products are lagged 1 month.

[5] Some prices for industrial chemicals are lagged 1 month.

[6] Not available.

r = revised.

PRODUCTIVITY DATA

PRODUCTIVITY DATA are compiled by the Bureau of Labor Statistics from establishment data and from estimates of compensation and output supplied by the U.S. Department of Commerce and the Federal Reserve Board.

Definitions

Output is the constant dollar gross domestic product produced in a given period. Indexes of **output per hour of labor input,** or labor productivity, measure the value of goods and services produced per hour of labor. **Compensation per hour** includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. The data also include an estimate of wages, salaries, and supplementary payments for the self-employed, except for nonfinancial corporations, in which there are no self-employed. **Real compensation per hour** is compensation per hour adjusted by the Consumer Price Index for All Urban Consumers.

Unit labor cost measures the labor compensation cost required to produce one unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current dollar gross domestic product and dividing by output. In these tables, **unit nonlabor costs** contain all the components of unit nonlabor payments except unit profits. **Unit profits** include corporate profits and inventory valuation adjustments per unit of output.

The **implicit price deflator** is derived by dividing the current dollar estimate of gross product by the constant dollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

The use of the term "man hours" to identify the labor component of productivity and costs, in tables 28 through 31, has been discontinued. **Hours of all persons** is now used to describe the labor input of payroll workers, self-employed persons, and unpaid family workers. **Output per all-employee hour** is now used to describe labor productivity in nonfinancial corporations where there are no self-employed.

Notes on the data

In the private business sector and the nonfarm business sector, the basis for the output measure employed in the computation of output per hour is Gross Domestic Product rather than Gross National Product. Computation of hours includes estimates of nonfarm and farm proprietor hours.

Output data are supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics.

Beginning with the September 1976 issue of the *Review*, the productivity tables were revised to reflect changeover to the new series—private business sector and nonfarm business sector—which differ from the previously published total private economy and nonfarm sector in that output imputed for owner-occupied dwellings and the household and institutions sectors, as well as the statistical discrepancy, are omitted. For a detailed explanation, see J. R. Norsworthy and L. J. Fulco, "New sector definitions for productivity series," *Monthly Labor Review*, October 1976, pages 40–42.

28. Annual indexes of productivity, hourly compensation, unit costs, and prices, selected years, 1950–81
